I do not think that there is much doubt about this case. The fact that this flavor in the cream and milk develops intermittently indicates that it is from a weed source. There are a number of weeds that come up with the young grass and that are very apt to have an acid and probably coagulating effect on the milk or cream. This effect is probably intensified by the addition of the flavoring substances, which contain alcohol. The alcohol would not lessen the effect of the flavor but would probably extract it and maybe intensify it as well. It is probably not practical to endeavor to eradicate this weed but close pasturing might help the matter somewhat.

* * *

Grade Milk and Cream.

We have your inquiry of June 3rd, and read carefully the question which you asked. We are not authority on this question but will say we have noticed this peculiar flavor some, but it has never given us any trouble with our customers. Of course we have many off flavors in the spring, such as onions, garlic, rye, pastures and weeds and also a pronounced grassy flavor.

The flavor which is so pronounced is noticeable in the butter, so it must be incorporated in the fat rather than in the milk serum. We always try to eliminate any off flavors by grading out such milk and cream and placing it in the second grade butter, as that is more practical than to use such flavored milk or cream and then try to cover same with some added flavor or substance.

* * *

Feed Right After Milking.

The method of overcoming this difficulty is to have the cows consume this feed long enough in advance of the milking period so that the odors will pass from tissues of the body through the excretory channels before milking time. The time requirement is usually considered to be eight to ten hours before the milking period. This means that if the cows are fed these green crops shortly after one milking period, the odors will have escaped before the subsequent milking period and the objectionable flavors in the milk will be lessened or entirely eliminated.

FIRM RE-ORGANIZES TO MAKE PNEUMATIC WATER SYSTEMS.

With the recent filing at Lansing of articles of association, the Grand Rapids Manufacturing Company, capitalized at $25,000, manufacturers of patented pneumatic pump and tank equipment for farms and suburban homes, as well as several other appliances, becomes one of Grand Rapids' new industries.

Officers of the corporation are: President, B. A. Yarrington; vice-president and secretary, H. V. Walsh; treasurer, R. H. Yarrington; sales manager, W. G. Finch.

The Grand Rapids Manufacturing Company was formerly a co-partnership with B. A. Yarrington and H. V. Walsh as proprietors, and for the last four years has been building special machinery and doing experimental work.

Two years ago the concern began developing water pumps and about one years ago brought out what is known as the Artesian Pure Water System, a pneumatic pump which can be installed in wells of any depth and will lift water any reasonable height under pressure.

Demand from modern farmers and increased number of suburban homes has created a demand for pressure water systems. The company already has a wide distribution, many orders coming from the east.

Mr. Finch who invented the Finch Weibach, a liquid weighing machine, resigned from the William G. Finch company, Inc., some time ago and purchased an interest in the Grand Rapids Manufacturing Company.

B. A. Yarrington, president of the company and a well known draftsman and designer, has resided in Grand Rapids for several years. H. V. Walsh, vice-president and secretary, was formerly with the Oliver Machinery company.

Other devices developed by the company include a scale for weighing and recording liquids which pass through a pipe line. Ice cream, dairy and creamery equipment, including milk pasteurizers and tubular coolers are also products of the company.

The company has plans for a one story brick daylight factory in the southeastern part of the city. As all of the real estate transactions necessary have not been closed the location is being withheld at present.

AERO ICE CREAM ADVERTISING SIGN.

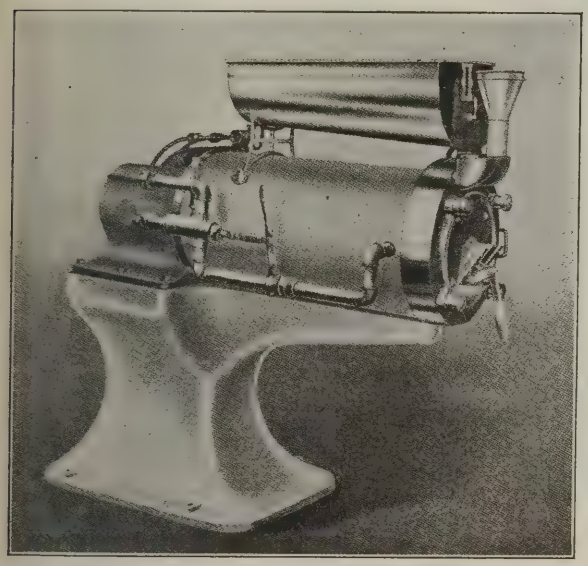
Noakers, Canton, O., ice cream manufacturers put across one of the most successful advertising stunts in the history of the concern recently through the medium of the areo advertising sign, the invention of a Canton man, and the first sign of this type to make its appearance in this country.

L. J. Bletzer, advertising manager, succeeded in tying up the rights for the Noaker Company exclusive for a specified time and now their signs dot the highways for 50 miles around Canton.

This wind mill type of sign is mounted on an all structural steel tripod and revolves on Timken bearings. There are four wings with advertising matter on each of the eight sides. The weight is suspended and the

slightest motion of the wind propells the sign, which is bound to attract the attention of the passerby. The display advertising type is of such prominence that it is discernable for several hundred yards.

The whole tower revolves as do each of the individual wings. Each of the display signs are five by ten feet and give the advertiser aproximately 400 square feet of advertising space.



Bletzer says it is the greatest trade puller he has yet used to exploit the firm's merchandise and is using 50 of them at the present time.

Now Only $700

40 Quart Capacity

U. S. Heavy Duty Freezers

Equipped with Hinged Cylinder Cover, the famous U.S. Vertical Discharge Mechanism, Special Government Bronze Bearings, Batch Tank with Ground in Taper Cream Valve, Detachable Nickle Plated Fruit Hopper, and our Efficient Tripple By-Pass Piston Brine Control Valve.

They are built on the bolted together unit principle of assembly (all parts being interchangeable) and are easily converted to motor drive if desired, in the user's place of business. There is no iron or other corrosive metal to wear or come in contact with the cream inside the freezing cylinder. The front end of dasher is held in alignment by a removable bearing and support which are independent of the cover. The shafts and gears are of extra heavy construction and are made of the finest materials, accurately machined. The brine jacket and passages are readily accessible for inspection and cleaning and there are no soldered joints to open up and leak.

The Whipping Device is of the most improved double dasher type, developed to give the finest velvety texture to the finished ice cream and to secure the desired overrun without fail. It is easy to remove, clean and re-assemble. There are three separate splashless openings,—one for cream, one for fruit and a third for use as a peep hole.

25 Used and Rebuilt Freezers of Other Makes

Bargain Prices **$200 and Up** ***Ready for Use***

These were replaced by U. S. Heavy Duty Freezers and taken in trade by us as part payment. All have been thoroughly overhauled (some at factory where built) and have not been used since. Every one is therefore in good condition ready for service. These rebuilt freezers include motor and belt driven machines of the following makes:—Miller, Miller-Tyson, Tyson, Progress, Emery Thompson, Cherry and Fort Atkinson.

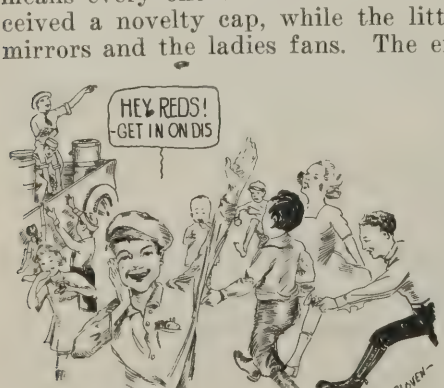
Feast on Ice Cream at Imperial Plant Opening

By B. W. Newell, Barker, Duff & Morris

IT IS the ardent and consuming wish of all small girls and boys that once in their lives they be allowed to eat as much ice cream as they can conveniently hold. And, on Wednesday, May 24th, the Imperial Ice Cream Company—in opening their new plant at Huntington—played the part of good fairy in making that wish come true.

It was a great day for the children from the moment the parade of gaily decorated trucks left the factory until the last morsel of ice cream was consumed by a youngster with bulging eyes whose anxious query was, "Will there be another party tomorrow?" Men stationed on the big yellow packing trucks threw away more than ten thousand Imperial Alaskas and the line of march was one continuous stream of ice cream-eating men, women and children. As the burden of one truck was disposed of, another was unloaded and at six o'clock cars and automobiles—one continuous concourse of expectant humanity. The crowd was so great that no less than six policemen and a force of nearly twenty-five guides were required to handle them. Ice cream was there and the crowd came to get it. Ropes were torn down, attendants thrust aside and order generally disregarded in the mad rush of shouting, clamouring and struggling youngsters. In all, however, the party was, according to officials of the company, one of the most orderly and systematic affairs ever held. From the first moment the doors were thrown open until the last tired but happy visitor departed homeward, the plant was thronged with a continuous stream of interested and complimentary guests.



A serving table was laid out for the youngsters in a nearby field, while the grown-ups were served in the large garage in the rear of the plant. Hundreds of the

Latest Addition to Imperial Ice Cream Company's Chain of Plants.

in the evening officials of the company estimated that more than fifty thousand portions of ice cream had been consumed. In addition to chocolate and vanilla, there was a generous supply of fresh strawberry ice cream, cherry nut, banana custard and a variety of other delicious flavors. One little youngster, a chocolate cone in one hand and a vanilla in the other, eagerly sought a guide to find him an additional plate of strawberry.

Every youngster who was given ice cream—and that means every one within ten miles of the city—also received a novelty cap, while the little girls were given mirrors and the ladies fans. The enormous size of the crowd and the eagerness with which it pressed forward to view the plant and receive their treat was all that prevented each visitor from receiving personal attention.

The doors of the plant were thrown open as soon as the return of the parade, but long before the hour announced, throngs had gathered about the plant eagerly clamouring for admission. They came on foot, in street children were seen to eat six to a dozen cones or plates of ice cream, while many of the elders kept them company, so warm was the afternon, and so delicious and cooling the refreshment served.

On Tuesday afternoon, May 23rd, Mr. O. E. Cullums, local manager for the Imperial Company, played host to the Ice Cream dealers of Huntington and vicinity, at a reception held in the new plant. More than one hundred and fifty dealers with wives and families attended the reception and, following a trip through the building, were served a buffet luncheon and presented with attractive souvenirs of the event.

The Huntington opening was attended by the following directors of the company, who rode in the street parade and who took a prominent part in the public reception: A. G. Sine, George W. Strong, C. T. Hiteshew, J. H. Randolph and T. J. Swager. Mr. W. M. B. Sine, general manager of the Imperial Company, was absent due to illness.

The new Huntington branch is one of the most modern in the chain of seventeen plants located in West Virginia, Virgiania, Maryland, Kentucky, Pennsylvania and Ohio. Engineering work on the new structure was handled by McCormick and Company of Pittsburgh and New York, while the general contracting was done by the C. W. McNulty Company. The general equipment and facilities of the new plant represent the last word in efficiency and sanitation, while the general layout o

"That's the Ice Cream"

HUDSON FLAVORED Ice Cream is remembered. People like it and want more of it. They look for it and often will go out of their way to get it. There's something so distinctly pleasing about its flavor that folks just naturally prefer ice cream that's Hudson Flavored. Moreover, Hudson's Flavors are dependable; spring, summer, autumn, winter, the quality is always uniform. Consequently, folks stick to Hudson Flavored Ice Cream and that's one of the chief reasons why so many ice cream manufacturers have been using Hudson's Flavors regularly and continuously for the past thirty-four years.

Some ice cream makers prefer our Extract—others, our CONCENTRATED. In most cases it is more economical to order CONCENTRATED. We'll be glad to send either on approval.

HUDSON'S FAMOUS ICE CREAM FLAVOR VANILLA AND TONKA BLEND No. 52 SPECIAL

$5.00 per Gallon . . . . . in Barrels

Mfg. Co., Detroit.

New Storage Plant at Columbus, Ohio.

The announcement that the incorporation papers of the Tecumseh Cold Storage Company had gone to Columbus was made recently. The authorized capital will be $300,000. Option has been taken on property on Tecumseh Street and the Cloverleaf railroad.

W. P. Rosevear, formerly with the Continental Sugar Company, together with Alex Arnold, Sam Kohn, R. S. Cone and John Schoepfle, Elyria, are named as incorporators.

The plant will have 1,500,000 cubic feet of space, according to preliminary plans.

* * *

The Wells-Chief Creamery Company, Crestline, Ohio, is considering building a new plant. They have purchased a 1 and one-half ton truck to add to their equipment.

* * *

Wm. Isaly of the Isaly Dairy Company, Mansfield, O., will make a trip to Switzerland and other European countries.

* * *

Chas. Beardsley, formerly manager of the Wells Creamery Co., Crestline, O., has moved his family to Delphos, O., and is now manager for the Wells Creamery Company there.

* * *

C. F. Linkhart, formerly with the Mansfield Pure Milk Company, Mansfield Ohio, is now interested in the Muldoon Dairy Company at Ft. Wayne, Ind.

* * *

City Dairy Company of Toledo Has Been Sold.

The City Dairy Company, which has been in the hands of receivers since December 15, 1921, was sold at auction Monday to C. C. Martin of Luckey, O., for $35,000. The only other bidder was Thomas Ammerx of Milan, Michigan.

* * *

The Buckeye Dairy Company, Galion Ohio, is now open for business. Mr. Weeks says they are doing nice business so far.

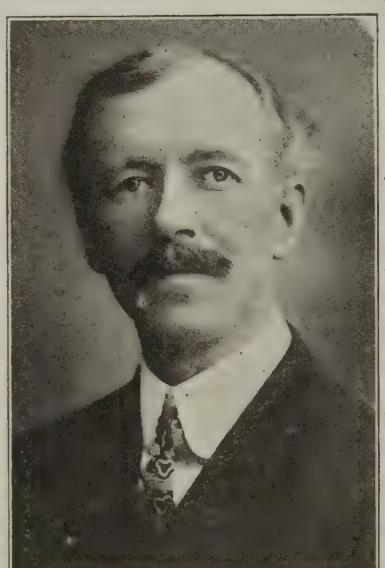
Scott & Fenner, Williard, Ohio, have now been running their ice cream plant for some time, they are a new firm.

* * *

The Findlay Dairy Company, Findlay, Ohio, have enlarged their offices and made other improvements in their plant, and report that they are doing a nice business. Mr. Gill, their ice cream maker, is putting out some nice ice cream and fancy creams and ices. The town is taking to his goods very readily.

Collins' Ice Cream Company at La Porte, Ind., is doing a nice business and have made some imyprovements in the plant.

R. A. Kerr, Urbana, Illinois, has installed a new Emery Thompson freezer, a York 4-ton refrigeration machine, a new cold storage room with 1000 gallon capacity, also a Creasey ice crusher. Everything is driven by electric motors. Mr. Kerr now has a splendid plant, and is doing a fine business.



* * *

The Heckler Company, Napoleon, Ohio, have moved into their new building, a cement block structure, 50 by 100 feet. They are manufacturers of ice cream and soft drinks. They do a large business, and with their new facilities they expect to double it. This plant is now one of the best on the west side of the state. Many new improvements have been made, and more will be made as circumstances justify. C. J. YUNKER.

⚜

ROBERT T. HUGHES, LONG ILL, IS DEAD.

Robert T. Hughes, president of the Hughes Gelatine company, Detroit, Mich., died May 20th in Grace hospital. He had been ill for four months. Mr. Hughes, who was in his fifty-ninth year, was a native of Detroit.

ROBERT T. HUGHES.

Mr. Hughes's parents, came to the United States from Wales in 1849, settling in Detroit shortly after their arrival. Robert was , born August 21, 1863.

At the age of 14 circumstances made it necessary for him to earn his own living. After working for a while for George R. Angels, he took a position in the laboratory of the Farrand-Williams Drug company. He remained there 10 years and then became representative of a New York glue concern. He held this post until 1902 when he organized the Fisher - Hughes Gelatine Company.

Five years later this company had to suspend operations and Mr. Hughes found himself facing the necessity of starting over again. In 1908, with only limited capital, he formed the Hughes Gelatine company, which he built up into a most successful enterprise.

He is survived by his widow, Mrs. Grace M. Hughes; a son, Lloyd L. Hughes, 82 Hazelwood Avenue, and a nephew, Albert J. Hughes.

Are You Going To Run Your Plant This Winter--Or Shut Down

Place "Northwestern" bar cabinets in full view of the public, and watch the daily sales increase to thousands. It means dollars in your pocket to faithfully protect and stimulate the sales of Ice Cream Bars.

Preserve the excellence and deliciousness of this new, nationally popular confection by serving them frozen solid—the way they are intended to be.

This remarkable device, (it sets right on the counter), has three times the refrigeration of the best cabinet made, and a few pennies worth of ice and salt a day will keep a temperature around zero for 24 hours. The saving in ice; the extra sales; the resales; the satisfaction; the time saved; the sanitary handling; pays the initial cost in no time.

A Freezer—Display Cabinet—Cold Storage—Dispensing Medium—ALL IN ONE.

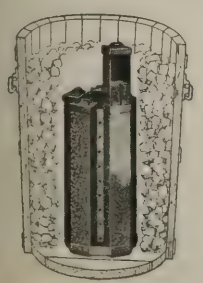
A small fraction of a second only is required to bring one of the bars from the inside of the dispenser at the bottom, (the coldest point), to the outside. A simple turn of the handle slides one of the bars instantly through hanging trap door. The action is so quick that there is practically no chance for warm air to enter. The entire contents, 36 bars, can be emptied in less than a minute, should this speed be necessary. No covers to lift off. This is the main reason of the ice economy.

QUICKLY FILLED

Three dozen ice cream bars can be placed in the cabinet in less time than it takes to tell. Two removable magazines permit you to fill them at the place of your reserve stock. These magazines are also a prevention of any salt or ice coming in contact with the bars.

The entire cabinet is built of heavy galvanized steel; wood; cork; iron and brass. The delivery mechanism is made of rust resisting metal. The ice receptable is surrounded completely with full 2 inches of cork board. The cabinet has been put to the most extreme tests and in every case has made ice cream bars 100% salable.

Dimensions — Height 27 inches. Width 14 inches. Depth 14 inches. Weight, crated for shipment, 85 pounds.



Price, $37.50

SPECIAL PRICES TO ICE CREAM MANUFACTURERS

SECTIONAL STORAGE CONTAINER

Holds 100 Ice Cream Bars. Made to Fit in the Regular 5 Gal. Ice Cream Tub.

A necessary device to prevent your ice cream bars from becoming soft. A perfect storing place for bars in shipment or held as a reserve supply. Absolutely necessary for the manufacturer for delivery and shipment of ice cream bars. This device used in conjunction with the "Bar Freezer" eliminates all trouble and loss heretofore encountered.

Price **$12.00**

Special Price to Manufacturers.

Cabinets are furnished in pure white laquer; plain or lettered as wanted. Let us show you proofs that these devices increase sales 100 to 500%, and HOLD THE TRADE.

OPERATION MADE EASIER AND MORE ECONOMICAL BY SUPERIOR TANK EQUIPMENT.

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir: We are figuring on discontinuing the use of sweetened condensed and using 8% evaporated milk and milk powder. Our aim is to have about 12 to 13% fat and 22 to 23% solids not fat.

Any information as to the betterment of the quality of the following batches, will be greatly appreciated.

Enclosed find two different ice cream batches. Kindly suggest any changes you would make.

M. C. CO.

Reply: I have analyzed your two batches of ice cream. You will find the analysis given below in Table No. 1 and Table No. 2.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
415.0 lbs. 17% cream	70.55	32.61	103.16
75.0 lbs. skimmilk condensed	.....	20.25	50.25
35.0 lbs. sugar	.....	.....	33.25
3.0 lbs. gelatine	.....	.....	2.75
25.0 lbs. water	.....	.....	.....
2.0 lbs. vanilla	.....	.....	.30
30.0 lbs skimmilk powder	.....	28.50	28.50
585.0 lbs.	70.55	81.36	218.21
Per cent	12.06	13.9	37.3
Per cent sugar	11.0		

Table No. 2.

Ingredients	Fat	Serum Sol.	Total Sol.
336.0 lbs. 16% cream	53.76	25.10	78.86
90.0 lbs. 7% condensed	6.30	17.10	23.40
60.0 lbs. sugar	.....	.....	57.00
30.0 lbs. skimmilk powder	.....	28.50	28.50
3.5 lbs. gelatine	.....	.....	3.32
25.0 lbs. water	.....	.....	.....
2.0 lbs. vanilla	.....	.....	.30
546.5 lbs.	60.06	70.70	191.38
Per cents	11.00	13.6	35.0
Per cent sugar	11.0		

You will note that the first table tests about 12% and the second about 11% butterfat. You will also notice that your formula contains a high per cent of milk serum solids. In the first formula you have 26% total milk solids and the second about 24.5%. I imagine that the second formula makes a more satisfactory ice cream than the first one.

If you are going to use 12 to 13% butterfat it will not be necessary to use over 9% milk serum solids for a satisfactory ice cream. If you will increase the per cent of sugar in order to make the total solids around 34%. A good many factories are now using 13% to 14% sugar while you are using only 11% in both of these formulas.

You could materially reduce the cost of your ice cream mix by increasing your sugar content by 2% and reducing the serum solids 3% or 4%. You can easily do this by using less sweetened condensed or evaporated milk or milk powder.

* * *

Dear Sir: I now ask you for further information, this time, with reference to the use of glucose in the manufacture of ice cream. Is it to be recommended; if so, in what quantities or proportions, and what per cent of solids does it contain? C. C. T.

Reply:—You probably recall that during the war common syrup or glucose was used as a sweetener of ice cream. This was done, however, because it was impossible to obtain a sufficient amount of sugar.

In my opinion, glucose is very much inferior to sugar and will not produce the flavor in ice cream that pure sugar will. The solids content of glucose varies from 60 to 80 per cent having an average of about 70 per cent. If I were to use glucose in any way to replace some of the sugar I would not try to replace more than one-fourth of the sugar, but you must also realize that glucose is not as sweet pound for pound as sugar. One pound of sugar being equal to nearly two pounds of glucose as a sweetener.

* * *

Dear Sir: I wanted to make ice cream of milk and cream. My wish is to make a good wholesome cream that the public would like, so would like for you to put in the formula what you think would make the best cream. O. R. L.

Reply:—I have your letter at hand with more specific directions as to what you desire in the way of an ice cream mix. From the data given in your letter I still am not able to figure out just exactly what you want. The regular commercial ice cream in Oklahoma requires 10 per cent butterfat and 32.5 per cent total solids. This is law in Oklahoma and ice cream must not come below these requirements.

A good commercial formula for you would be to use for ten gallons of ice cream; 7 pounds of sugar; one-fourth pound of a good grade of gelatine and 42 pounds of milk and cream. In order to get at the butterfat content, however, I would have to know what your cream would test for butterfat and what your milk would test for fat in order to tell you just how much milk and cream to use.

You can easily understand the amount of fat in milk and cream will vary with the ratio of the cream and milk. If you will tell me about what your cream tests and your milk tests, I can give you a better idea of how much of each to use.

* * *

Dear Sir: I wish you would kindly give me the following formulas, for making orange emulsion, lemon emulsion and chocolate ice cream flavoring using chocolate liquor and cocoa. My trade want their chocolate ice cream to be very dark, in fact, they prefer it to be about the shade of the coating on chocolate creams. Can you assist me in obtaining the desired color?

Can you tell me how to mix dry colors to make a liquid color to be used in coloring ice cream? A. R. S.

Reply:—I have your recent letter with request for some information on the making of orange and lemon emulsion and a flavoring for chocolate ice cream.

You can secure the right kind of chocolate, which will enable you to get a dark color to the chocolate ice cream. Many ice cream factories use a caramel color to increase the shade.

You could undoubtedly hear from the supply house relative to the matter of the overrun tester. I suggest that you can find the names of at least three concerns manufacturing these emulsions, in the advertisements in The Ice Cream Review.

* * *

Dear Sir: I am glad to know I have improved my mix. While some say it is a good commercial ice cream we aim to make it better than a commercial ice cream. We supply mostly hotels and private trade, therefore, I suppose, by adding a can more cream to mix No. 2 it would improve it still more. F. S.

Reply:—I suggest that if you want your product to be much better than a regular commercial ice cream that all you will have to do will be to add more cream

Retinning Ice Cream Cans

SPECIAL DEPARTMENT

Old Cans Made New at Low Cost

And we do know how to fix up your otherwise hopelessly rusty old cans so they will be tight and bright and good as new. ***It is not expensive*** and ***pays you a dividend.*** A can retinned by us has a thicker coat of Pure Block Tin than when new.

We do refinishing of old ice cream cans in a special department of our plant which devotes its entire time throughout the year to doing this one thing and doing it well.

Sample Can Retinned Free

Send us a sample can NOW. We will repair and retin it without charge and return it promptly, so you can see the quality of our work. Write us when you ship it, so we will know whose it is, and we will do the rest.

OAKES & BURGER COMPANY

Established 1873 **CATTARAUGUS, N. Y.**

and increase the butterfat content which will also increase the solids content.

I would not attempt to make ice cream test higher than about 16 per cent butterfat and I shall be very glad to analyze another mix for you if you think that I can assist you further.

* * *

Dear Sir: We would like to use two formulas one of fourteen and one of eighteen percent butterfat. Using raw sweet cream, have a Disc Continuous Freezer. Kindly work us out a formula so that we may use the above percentage of butterfat, also using sugar, gelatine vegetable gum and sweetened condensed milk. M. C. Co.

Reply:—With the suggestions in your letter I am suggesting below in Table No. 1 and No. 2 ice cream mixes testing 14 per cent and 18 per cent butterfat from the ingredients mentioned in your letter.

Table No. 1.

100 lb. Mix—14% Fat.

Ingredients	Fat	Serum Sol.	Total Sol.
9.0 lbs. sugar	.....	.....	8.55
.5 lbs. gelatine and gum	.....	.....	.47
10.0 lbs. sweet condensed	.....	2.70	6.70
42.0 lbs. 30% cream	12.60	2.61	15.21
38.5 lbs. 4% milk	1.54	3.30	4.84
100.0 lbs.	14.14	8.61	35.77
Per cent sugar	13.0		

Table No. 2.

100 lb. Mix—18% Fat.

Ingredients	Fat	Serum Sol.	Total Sol.
6.6 lbs. sugar	.....	.....	9.12
.5 lbs. gelatine and gum	.....	.....	.47
6.0 lbs. sweet condensed	.....	1.62	4.02
56.0 lbs 30% cream	16.80	3.50	20.30
27.9 lbs. 4% milk	1.10	2.39	3.49
100.0 lbs.	17.90	7.51	37.40

If these two formulas do not seem to meet with your requirements I shall be very glad to go over this matter again if you will give me additional information.

Dear Sir: Below are three formulas and would appreciate having you check these over, and make any suggestions which you consider would be an improvement.

No. 1.

Sweetened Condensed—Milk Powder—Butter.

Ingredients	Fat	Sugar	M.S.N.F	Gel.
900 lbs.	8%	12%	14%	.05
8 lbs. gelatine	....	....	....	8
270 lbs. sweetened condensed	....	108.0	72.9	...
85 lbs. butter	72.0	....	....	...
53 lbs. milk powder	....	....	53.1	...
484 lbs. water	....	....	....	...
900 lbs.	72.0	108.0	126.0	8

No. 2.

Skim Condensed—Concentrated.

Ingredients	Fat	Sugar	M.S.N.F	Gel.
900 lbs.	8%	12%	14%	.05
8 lbs. gelatine	....	....	....	8
85 lbs. butter	72.0	....	....	...
270 lbs. skim condensed	....	....	72.9	...
98 lbs. concentrated skim 6-1 54%	....	....	53.1	...
108 lbs. sugar	....	108.0	....	...
331 lbs. water	....	....	....	...
900 lbs.	72.0	108.0	126.0	8

No. 3.

Ingredients	Fat	Sugar	M.S.N.F	Gel.
900 lbs.	8%	12%	14%	.05
8 lbs. gelatine	....	....	....	8
85 lbs. butter	72.0	....	....	...
233 lbs. concentrated 6-1 54%	....	....	126.0	...
108 lbs. sugar	....	108.0	....	...
464 lbs. water	....	....	....	...
900 lbs.	72.0	108.0	126.0	8

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—St. Paul-Minneapolis, Oct. 7-14.

You will note that concentrated skim is used in two of the formulas. I have calculated this on the basis of 54 per cent total solids, as it is condensed 6 to 1. Is this the correct percentage? In using concentrated do you think there is danger of sandy ice cream, due to the high condensation? G. J. M.

Reply:—I find that all three of these formulas ought to make up a good product. You will note, however, that you are using 14 per cent milk solids not fat in all three formulas. I am a little in doubt whether you can get away with such a large percentage of serum solids without serious results.

If I was in your place and making ice cream I would cut the serum solids to 12 per cent as that would still give you the 20 per cent total milk solids which, in my opinion, is plenty of solids. Should you do this it might be advisable to replace the serum solids with a little extra sugar. You could very easily use 13 per cent to 14 per cent sugar in an 8 per cent butterfat ice cream.

I do not know whether you have had any trouble with sandy ice cream or not but my advice has been for several years not to use more than 12 to 12.5 per cent milk serum solids if sandiness is to be avoided.

I am not familiar with the concentrated skimmilk which you are using in two of your formulas. I am of the opinion, however, that a concentrated product containing 54 per cent solids would very easily cause "sandy" ice cream, especially, if this concentrated product was held for any length of time after being manufactured.

TRUCKS FOR THE DAIRY INDUSTRY.

The handling of materials in the dairy plant is always a big problem. How to keep costs down to the minimum is always an important item. Bulletin C-6 just published by the Nutting Truck Co., Faribault, Minn., is available to any reader of this publication free of charge. Tell the Nutting people that you want a copy.

PERSONALS.

There are a lot of good fellows who are not in the ice cream business in spite of the fact that there are so many in it. "Birds of a feather flock together," and down in Corsicana, Texas, we know of a couple of mighty good fellows, one in the ice cream business and one in the music business, When B. H. Frick, general manager of the Frick Ice Cream Company, learned that his good friend, J. T. Newsom, president of the Southwestern Music Company and president of the Corsicana Advertising Club, contemplated a trip to Milwaukee, he right away insisted upon his making us a call. Mr. Newsom attended the big convention of the Associated Advertising Clubs of the World, and found time to come and see us in our new home. We enjoyed his company and we wish he were in the ice cream business. Thanks, Friend Frick, and when you can send another live wire to see us be sure to do it. We like the way those Texas fellows boost for their state, their town and their friends.

MOTHER GOOSE CALLED UPON TO ADVERTISE ICE CREAM.

"Baa, baa, black sheep,
Have you any cream?"
"Yes sir, New State—
Have a dish supreme."

The spirit of Mother Goose was a busy shade recently in the vicinity of Oklahoma City, Oklahoma, furnishing inspiration to some 5000 rhymsters who sought to parodize her original compositions. The reason for it all was that the New State Ice Cream Company of that city saw fit to stage a contest in which they offered prizes for the best parodies on Mother Goose rhymes which furnished a boost for New State Ice Cream. The composers themselves ranged from college professors to shop girls and from staid business men to tiny children. From all over the southwest, entries came with every mail, until the judges found themselves in the midst of a giant sheaf of neat sheets of paper each bearing a light, airy verse about the latest innovation in ice cream.

Prizes awarded as follows: First, $100; second, $50; third, $25; fourth, $25; fifth to fourteenth, each $10; fifteenth to twenty-fourth, each, $5; twenty-fifth to fiftieth, each $2; and twenty-five other awards of a dozen Polar B'ars each.

Here is a stunt for advertising ice cream that is so unusual as to deserve special commendation. As a means of popularizing the product of this company, no better method could have been originated. 5000 people will now feel that they have a personal interest in this company, and in all probability more than again as many have had the company and product brought to their attention in such a way as to make a relatively lasting impression.

This is just one of many similar clever methods of advertising their product that this company has adopted. Their remarkably rapid growth furnishes proof of the fact that it pays to advertise ice cream.

LONG BEACH FIRM TO MANUFACTURE ICE CREAM.

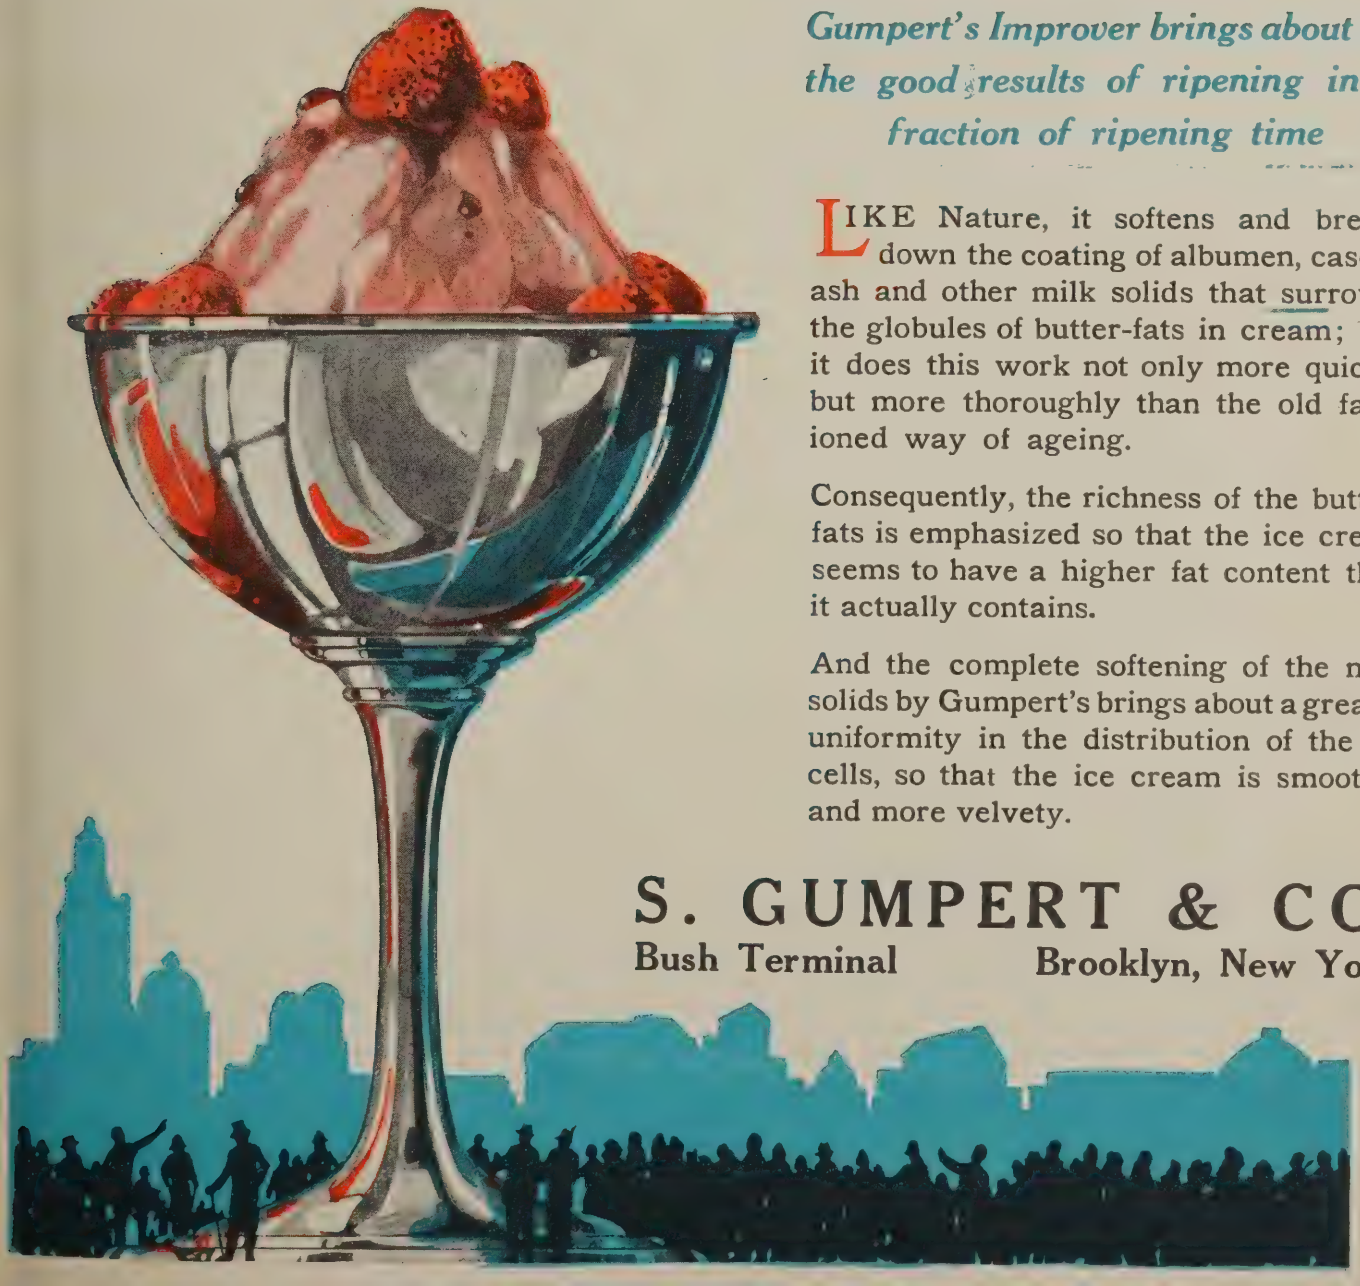
The Consumers Milk Company, a new dairy concern, which is to operate in Southern California, and which will operate independent of any association or other organization, will establish an ice cream plant of 3,000 gallon capacity per day in Long Beach in the immediate future. The main dairy plant of the company will be located in Los Angeles, with an 8,000 gallon capacity.

The company will handle certified, guaranteed raw and pasteurized milk as well as a long line of other dairy products. The ice cream plant to be erected in Long Beach will start out with a 1,500 gallon capacity per day, but the installation of machinery and equipment will be arranged to take care of 3,000 gallons as soon as the business of the company justifies increased production.

The company has contracted for a supply of milk from approximately 2,000 cows to be delivered as soon as operations of the company are under way.

Officers of the company are:

President, O. R. Lee, Norwegian and Danish dairy expert, formerly manager Centralia Creamery company and Columbia Products company; vice president, C. H. Osborne, now manager Ford Farms, also manager Gate City Creamery company of San Bernardino, Calif.; secretary-treasurer, Homer Lawten, identified with the Alexandria hotel, Los Angeles; directors, Wm. Grissom and W. H. Rapson.—Long Beach Telegram.



Gumpert's Ice Cream Improver

The better the ice cream you make the more you'll sell!

It has been proven time and again that the amount of ice cream eaten by a community can be doubled or even trebled in a few years.

Take the instances in which newcomers enter the ice cream field and build up a big business. How does it affect the original ice cream manufacturers in the community? In almost every case, their business ***increases!*** It seems that ice cream, when it is really good, proves the old, old saying, ***"The more you eat, the more you want."***

Gumpert's Improver brings about all the good results of ripening in a fraction of ripening time

LIKE Nature, it softens and breaks down the coating of albumen, casein, ash and other milk solids that surround the globules of butter-fats in cream; but it does this work not only more quickly but more thoroughly than the old fashioned way of ageing.

Consequently, the richness of the butter-fats is emphasized so that the ice cream seems to have a higher fat content than it actually contains.

And the complete softening of the milk solids by Gumpert's brings about a greater uniformity in the distribution of the air cells, so that the ice cream is smoother and more velvety.

S. GUMPERT & CO.
Bush Terminal Brooklyn, New York

Just Three Weeks—

THREE weeks from the day it was made, and after repeated repacking, we again opened a five-gallon can of orange water ice that had been made with TEXTOR. The product was perfect—exactly the same as when it first came out of the hardening room—smooth, firm, even and uniform, without a sign of icy particles or separation.

Wouldn't you like to make water ices that would stand such a test?

You can do it with TEXTOR, and you turn out a product which, from the top to the very last scraping at the bottom of the can, has a wonderfully smooth texture, a perfectly uniform distribution of flavor and color—and a water ice that will keep as perfectly as ice cream.

Now you can conscientiously urge dealers to handle water ices and sherbets. TEXTOR-made water ices and sherbets will dip one hundred per cent. There is practically no shrinkage.

We want you to try TEXTOR in your own plant, absolutely at our expense, and here is our offer: We will ship you a 60 lb. drum of TEXTOR. Use 10 pounds, enough to make 350 gallons of water ice or sherbet, and if you do not turn out water ices that are the finest you ever ate, return the TEXTOR, and we'll call the deal square.

DAIRYING AND THE FEDERAL RESERVE BANK.

Creamerymen, cheesemen, ice cream manufacturers, milk dealers, in fact everyone connected with the dairy industry will recognize the deep significance of the compliment paid to dairying in the May 31st report of the Seventh Federal Reserve Bank. Whatever is good for the industry as a whole is reflected in the benefits which come to those who are dependent upon it. A brief survey of the report follows:

Despite the retarding effects of the coal strike, the general business situation is improving. Production in the basic industries has increased and improvement is reflected in manufacturers unfilled orders, while unemployment shows a marked decrease. The reduction of loans to member banks by the Federal Reserve Bank in the agricultural sections reflects the improved prices to the farmer and indicates the economical basis on which he is working. Dairy products show increased output and steady prices.

While bank loans in agricultural sections have been considerably reduced, owing to increased prices of farm products and distribution of War Finance funds, bankers in some localities state they will need accommodation to assist them in financing the growth of this years crop. **In those sections where dairying is a large factor,** however, reports indicate that the country banks will be able to finance the farmer, since the steady income from dairy products will provide for current expenses.

While there was a slight decrease in the total savings deposits and average accounts in the District, two of the states, Wisconsin and Michigan, leaders in dairying, showed an increase in the amount of savings deposits. The country banks particularly show an increase in savings deposits.

The above statements are not theories, but facts as brought out by the banks which are members of the Seventh Federal Reserve district. They prove anew the importance of the dairy farmer to the upbuilding and stabilizing of a community.

The monthly cream check takes care of current expenses. It gives the farmer an active bank account which is reflected in local prosperity. It is the official government reports, such as this from the Federal Reserve Bank that demonstrate the importance and the dependability of dairying.

The Dairy Division of the Bureau of Animal Husbandry of the U. S. Department of Agriculture has prepared figures based on census statistics which tell the complete story of the dairy cow. These figures will be graphically presented at the National Dairy Exposition at St. Paul—Minneapolis October 7-14, the mecca of everyone interested in the progress and development of the third largest industry of this country. Special low railroad rates have been arranged for and the hotel accommodations will be ample and everything will be done for the comfort and entertainment of its visitors to make the exposition a memorable one.

THANKS.

We were very much elated over the kind words the M-B Ise Kream Company of Waco, Texas, sent up from the South to us, when they said—

"The ICE CREAM REVIEW is read by every up-to-date ice cream manufacturer in the United States and advertisers will certainly make no mistake by introducing their product through your medium."

"Throw Away Your Brick 'Slabs'"

Quicker Brick Making at every Ice Cream Maker's Elbow

The old costly way was to fill, carry or truck the "slabs" to the hardening room (often the full length of the building) as many times as there were colors — opening and closing refrigerator doors, losing refrigeration — after hardening remove from the hardening room, strip, cut into bricks, wrap carton and pack—in all six to eight operations.

Rogers AUTOMATIC ICE CREAM BRICK MAKER

brings brick making right up to the Freezer's "elbow." No time wasted in hundreds of idle movements and steps. Rogers' Brick Maker saves the "fussing," lugging, leg work, etc., and does it at a fraction of the costs.

The saving in refrigeration over the old method of "keeping the doors swinging" will alone pay for the machine in a year's time.

Greater competition in the Ice Cream field makes a greater need of economy.

Put a Roger's Automatic Ice Cream Brick Maker on your pay roll and turn some of your old pay checks into dividend checks.

CALIFORNIA AND SOUTHWESTERN STATES ICE CREAM MANUFACTURERS' ASSOCIATION.

(Continued from page 26)

zation offer problems of more or less magnified importance comparatively speaking, which demand attention to the extent that color is often forgotten or carelessly used. Nevertheless, color has much significance in ice cream as in other things.

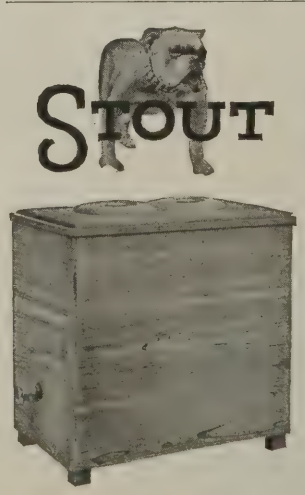
A moment's reflection will show us the significance of color in every-day life. Try to think, if you will, of anything in nature, any scene of any landscape, or, in our every-day life, of any article of food, any home, any room, or anything in which color is not present and playing an important part. The spring season of the year is colorful—and who can say that the flush of color that comes with this season is not responsible in some measure, for the refreshing qualities of the season. Then how about color in clothes and complexion in connection with personal appearance? It would, indeed, be a drab existence if we were all of the same color or colorless in regard to clothes and complexion. When it comes to complexion, it seems that in this day and age a good deal of importance is being centered upon artificial color. You will readily agree that the latter type of artificial coloring has limitations and that much could be said about its abuse. In discussing the type of coloring that has to do with ice cream, I hope that I may be able to point out or remind you of some of its limitations and abuses as easily.

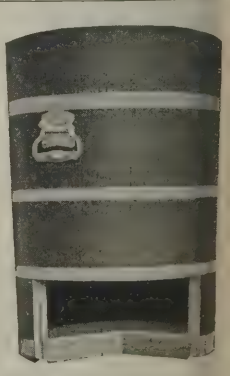
In this short discussion of color in general I have attempted to bring out the fact that color is so extensive that it must be of importance—to everything. Local color does not mean that color is confined to any area or any object, or group of objects. Color is universal. Color is omnipresant, hence it must be important wherever it may be. It must be important in ice cream as well as in other things.

The purpose of the use of certified colors in ice cream is, as I see it, to make the product more attractive in appearance, to give it a greater aesthetic appeal; to arouse and stimulate the appetite through the eye; to make ice cream more tempting and pleasing and more magnetic in its appeal to the consumer. To enhance its palatability since appearance has its effect on the palate. And all this to increase the demand and hence the salability of ice cream.

The natural color of ice cream, as well as of other products, is often dull and not particularly attractive. As in other products, ice cream manufacturers have made use of artificial certified colors to touch up and bring out the characteristic colors of the various kinds of creams. Your vanilla ice cream, for instance, without a slight amount of color added would turn out a pure white and not that creamy color one would expect of a product of cream and milk. Where would your various flavored creams be if we were to depend on fruits and extracts to bring out characteristic colors? Hence, it is obviously a good thing—a right and just thing that pure, harmless, certified colors should be used to put the finishing touch on ice cream, giving it the appealing, characteristic colors which it demands.

But this is as far as we go. After these uses have been made of certified color—color still has other uses or rather I should say misuses. Here limitations and abuse of color in ice cream set in which I will discuss presently.





There are three main classes of colors, that is:

1. Mineral or metallic colors.
2. Vegetable colors.
3. Coal tar dyes.

Coal tar dyes are by far the most efficient and useful. There are endless numbers of coal tar dyes, many harmless, some harmful, and still others unproven as to toxicity. The food manufacturer is limited by law to the use of seven of the coal tar dyes. All other coal tar colors and mineral and vegetable colors are prohibited. I have mentioned these other colors because they have been and still are being used. There are cases in which a manufacturer will intentionally use the most convenient color or unintentionally be using a color that should not be used. Perhaps you have heard of people who think that Rex Beach is a pleasure resort. It is a lack of observation which causes that. But, I dare say there are cases where observation is lacking on the part of the ice cream manufacturer, not concerning such an example as Rex Beach, but concerning the colors he is using in his ice cream. There are thousands of so-called food colors. Insoluble metallic colors are all dangerous. Cheap varieties of coal tar colors, in the manufacture of which salts of arsenic or similar salts have been used, are obviously dangerous. Therefore, it is up to every manufacturer to know the colors he uses, the class of color it is whether or not it is a coal tar color as it should be; whether it is certified or not and whether or not it conforms to all other regulations. It is because of the vast

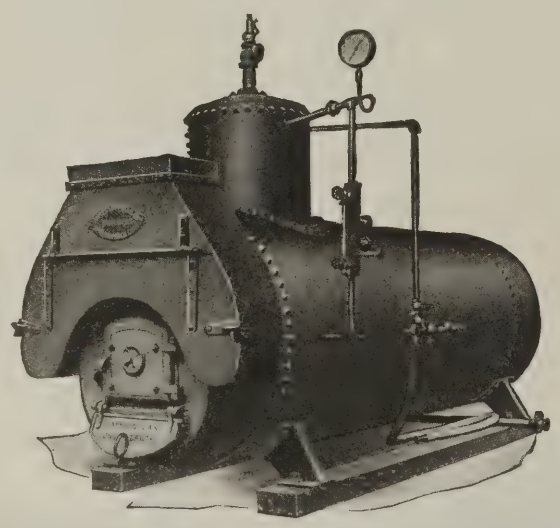
numbers of so-called food colors that limitations as to what colors may be used are set by law.

From the seven colors any desired color or shade thereof can be produced. All patents on the preparation of these colors have expired, making them available to every manufacturer. They are proven harmless; they are saluble in water and powerful coloring agents, an ounce of any of these colors being sufficient to color 2000 pounds of confections. Hence, they are ideal for all kinds of food coloring. With the purpose of restricting food colors to those whose harmlessness and desirability are proven beyond a doubt and for the purpose of making federal inspection and control of food colors simple and efficient colors used in foods have been limited to the above seven dyes.

These seven dyes are then not permitted for use in foods unless they are certified. By certification is meant a statement that the manufacturer has conformed to all government regulation as to purity and mode of manufacture of the dye and under government inspection.

And now coming to the limitations and abuse of color. It is my object in discussing this topic to emphasize the fact that there are limitations and abuses of color. to command attention to this problem of coloring, and to create sentiment on the part of this association of ice cream manufacturers decrying any existing misuse of color and any possible future misuse.



Some abuses of color are purely technical and are plainly illustrated by cases where too much color is used. It is policy to use color lightly, to a point where suspicion will not be called. A highly colored product conveys an impression of artificial color and to many people the impression that the product is artificial and adulterated throughout. For example a dark brilliant red strawberry ice cream. Mr. Dreyer mentioned the effect of hardening ice cream darkening the color and this factor should certainly be considered. Then, colors must be mixed carefully, with the addition of sugar or glycerine to the solution of color to prevent congealing and streaking of the color in the frozen cream. Certain colors, like green, purple and blue, should be discouraged because they are purely for coloring purposes and certainly do not suggest any natural flavor. Too much color and wrong shades of any particular color are common technical misuses of color.

Technical misuses and the use of inferior colors, non-certified colors, or colors not permitted by the food and drugs act are not by any means the only forms of abuse of color. In fact limitations and abuse of color only begin at the stage in ice cream as well as in other food products. The notorious form of abuse of color comes after these, even though pure certified colors be used. I am referring to the cloaking of inferior grades with attractive colors; I mean deception as to quality by means of the use of color. Here is a good example. Perhaps none of us have had this kind of an experience, but this has happened. Watermelons, in sections of the country and in seasons when drawing big prices, have been sold after being injected with a solution of red color giving the melon, which was poor in quality and appearance, or even green as grass, a luscious, ripe appearance. Generally, though, the consumer knows when he has been fooled and keeps the dealer or product in mind. Then there is the use of yellow color to imitate the presence of eggs in pastry. Perhaps the color is just as nice as the color produced by the yolk of eggs, but the only yolk present is, as the native of Sweden would say, another yoke ban on the public. There, undoubtedly, still exisits the manufacturer who thinks it is a joke on the public if he can make people think that certain pastry is rich in eggs when in reality it is rich in nothing but a little evil ingenuity and coal tar dye—yellow shade.

I have mentioned these forms of abuse of color in other industries for comparison but be sure that there are cases in which certain ice cream manufacturers may make use of similar tactics. I won't go into much detail but simply score one of the most common abuses of color made by ice cream manufacturers.

I have reference to highly colored creams. The psychology of such a practice is this: Imparting to cheap or even inferior products, intense and striking colors, nowise resembling their pure, uncolored prototypes, has a tendency to mislead the public, creating a desire for the highly colored article that pleases the eye. A product made of much better materials and better put together may not be quite so attractive except to those who know which is best by taste and test.

I particularly want to rap the practice of making French vanilla out of plain vanilla and egg yolkes a la coal tar dye. Some of us undoubtedly know of cases where such highly colored cream has been sold as French vanilla. Fraud vanilla, not French vanilla, is what it is. In some cases they come right out and sell the highly colored vanilla as French vanilla and in other cases it is simply implied that it is French vanilla, hoping to mislead the public just a little. But let me say that the manufacturer using such tactics is, figurative speaking, fishing for whale with trout tackle. The whale in the metaphor represents a big business with lasting satisfaction of the trade. It takes a sturdy tackle to land the whale. Quality throughout, including quality and

care in the use of colors means good tackle with which to go after the whale in the ice cream business.

There are many limitations and abuses of color. Hence, it is essential to the constructive program of the ice cream industry, in which we are all interested, to have every manufacturer study and know the colors he uses. Then to use them correctly; characteristic natural colors in every brand of ice cream in our state would do much toward convincing the public that ice cream everywhere is a genuine, honest-to-goodness food product and not an artificial or adulterated product which glaring, over-colored varieties might imply. Let everyone see to the certified colors he uses—correct them to the greatest extent possible and thereby put the standard of our product one notch higher.

The President: Any questions to ask Mr. Morrison? Any discussion on this subject?

Mr. Dreyer: I thought I would like to state this, that in the coloring of ice cream, especially vanilla ice cream, it looks better with a little tinge of yellow, and as an organization we probably could set a color standard similar to the way the acid test is made, a slight color within a glass tube. We had a yellowish colored paper within a glass tube and send it around to the different manufacturers and they could color by this standard set by the organization. I think that would help matters along and I think that could be done.

The President: Those are the matters that could be considered and investigated by the standards committee. That would be the proper way to approach that subject I should think. Any further questions? If not we will take up the next subject on the morning's program, "The Future of Brick or Package Ice Cream," by K. L. Carver.

A New Packing Tub

Built of Douglas Fir, a Pacific Coast shipbuilding timber; selected for its ability to withstand salt water and "stormy" handling.
A dove-tailed, double bottom 2 inches thick; armoured with a 12 gauge, galvanized iron band.
Using the expert knowledge gained from the manufacture of tubs since 1849, the Menasha Tub combines every quality calculated to give it Stamina and Carrying ability.

CHICAGO CINCINNATI NEW YORK ST. LOUIS
FOUNDED 1849

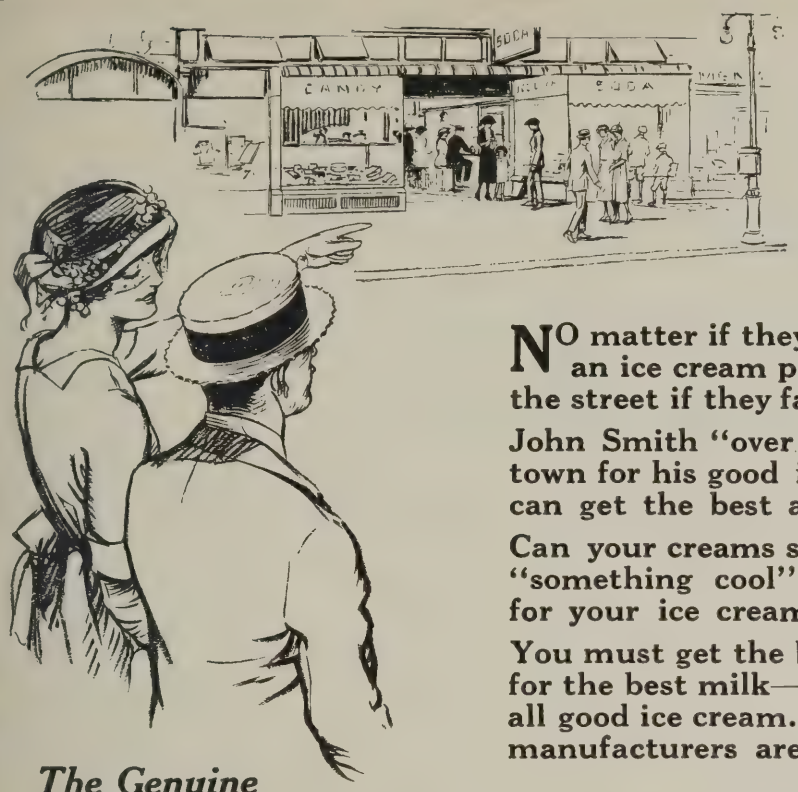
(Mr. Carver's address was published in the May, 1922, issue).

The President: This is an interesting as well as a practical subject. There should be some question and discussion on it. You have an opportunity for any questions or discussion. The hour is getting late but we will take a few minutes, if there are any questions to ask?

If not, the next subject on our forenoon's program is by Mr. Seba.

DOES OVERRUN INFLUENCE QUALITY IN ICE CREAM?

By Mr. J. H. Seba.



Mr. J. H. Seba: In connection with Mr. Carver's speech, which speaks of the possibilities of package ice cream, I would like to give you a little idea on it. The raisin people are just letting a contract for cartons which will provide sufficient packages of raisins for every other individual in the United States. You can therefore see the possibilities. At Mr. Carver's request to speak I will read my paper for you.

The tendency of manufacturers during the past few years has been toward an increasing yield in ice cream. This may be attributed to three sources, namely, increase in the cost of materials during the war, our greater knowledge of mixing and freezing processes and the rapid and extensive dissemination of this knowledge.

The various raw products used to make the finished ice cream were rising in price almost daily; the result was that the cost per gallon of mix was constantly tending upward while the selling price of ice cream did not increase in proportion. It was to be expected that the manufacturer would make an effort to sustain his customary margin of profit and the most effective way to accomplish this end was through increased yield.

Our knowledge of mixing and freezing processes has been much advanced in recent years. Our mixes and mix ripening methods have undergone radical changes. In the mixes we appreciate the fact that the building up with serum solids not fat instead of sugar and butterfat permits the use of a low sugar content which is more favorable to a high yield than a high percentage of sugar. The vacuum pan process of making mixes also has proved efficacious in producing higher average yields. The homogenizer is, too, an indispensable machine to the manufacturer who desires a high yield. Ripening time or the development of viscosity in the mix after pasteurization, has been reduced to a few hours instead of days. This has been brought about by the ripening enzymes, pure cultures and the direct addition of edible lactic acid.

The methods of freezing have been subjected to essential changes within the last few years and new means of production are constantly sought by the progressive manufacturer. The speed of the internal mechanism of the freezer has in some instances been increased 25 per cent above the manufacturer's rating. To obtain a uniformly high yield it has been found necessary to create a large surface area of the volume of mix in the freezer. This has put the vertical freezing machine practically out of the running for ordinary commercial work. Low temperature brine has not become popular until quite recently and brine pressure has been given practically no attention. Whipping the mix in the freezer while the brine circulation has been shut off is still a comparatively new mode of procedure in some plants. Overrun testers, several types of which now appear on the market, facilitate the increase of yield where the manufacturer has to rely upon more or less unskilled and inexperienced help. The use of carbon dioxide gas has

Let's Go over There

NO matter if they are standing right in front of an ice cream parlor—people will always cross the street if they favor the cream across the way.

John Smith "over there" is known all over the town for his good ice cream. People know they can get the best at his store.

Can your creams stand that test or are they just "something cool"? Do people cross the street for your ice cream?

You must get the best milk for good ice cream—for the best milk—pure and fresh—is the basis of all good ice cream. That is why careful ice cream manufacturers are placing their milk orders for

THE ASSOCIATION OF ICE CREAM SUPPLY MANUFACTURERS — MEMBER

Harold A. Sinclair

OUR ADVERTISERS AIM TO GIVE THE UTMOST SERVICE ALWAYS.

also come to the assistance of the over-run specialist and it is now possible to obtain almost any degree of excessive yield desired.

In times past new ideas or new ways of doing things passed very slowly from one person to another but now additions to our common stock of knowledge are rapidly and widely disseminated. The chief channels through which this knowledge is spread are the government experiment stations, trade associations and ice cream trade publications. Also, a knowledge of new schemes in the hands of an aggressive individual is soon put to use. Hence the increasing tendency of late to sell the retail dealer and consumer a large percentage of nature's free gift, air.

The increased yield resulting from these methods while they apparently seem highly desirable from a financial standpoint have drawbacks as well. Taking for example a mix which has 33 per cent total solids (10 per cent milk fat, 10 per cent serum solids not fat, 13 per cent sugar). A gallon of mix of this composition weighs approximately 9.04 pounds. One hundred per cent yield on this mix would give two gallons of ice cream weighing 4.52 pounds and 50 per cent by volume of air. This is all the "swell" that a 33 per cent total solid mix will stand and still produce a piece of goods which is palatable and has stability under average dispensing conditions. Increasing the yield to 110 per cent on a gallon of the above mix reduces the weight of one gallon of finished goods to 4.30 pounds. One hundred and twenty-two cubic inches out of a possible 231 are air. From the standpoint of food value, when the value of one pound of milk fat equals 4040 calories, a pound of serum solids and a pound of sugar 1820 each, the high yielding ice cream is less valuable by 150 calories per gallon. The consumer under these conditions looses in nourishing qualities the equivalent of a level teaspoonful of sugar on every dish of ice cream consumed.

Considered from the palatability angle the inflated ice cream has less flavor and aroma per given amount of flavoring material added. It does not give as great apparent coldness to the palate and leaves less indication of substance when melted. Slightly higher gelatine content will be required for stabilizing purposes and this produces a somewhat sticky body and gives a disagreeable gelatine after taste to the cream as it grows older.

A cream containing 50 per cent air will require the transfer of more heat units to bring it to a solid state than will a gallon containing 55 per cent air, but this advantage is quickly vitiated when it comes to packing and shipping. A gallon of ice cream with a high air content has not absorbed as many heat units, hence it will not have as many to give up before getting soft when placed under unfavorable conditions. It has less resistance to heat shock and this deficiency will have to be supplied by additional salt and ice. Having once become soft it cannot again be hardened to make a palatable product. It is not unusual for the ice cream salesman to have customers tell him that a certain brand of ice cream requires more salt and ice and more packing than, perhaps, some competitive brand of similar composition.

Again the dealer finds that he can get more cones, dishes of cream or cartons per gallon from another brand of cream which does not represent an excessively high yield. He has less shrinkage per packer. While from a superficial observation there is a direct and decided financial gain in excessive yield the manufacturer who pursues this policy has few and flimsy arguments with which to go after new business and his customers are bound to him only by a very slender thread of good will or because another and better grade of ice cream is not available to him.

Some manufacturers maintain a percentage of overrun sufficiently high to enable them to cut prices against their competitors. Such a situation is lamentable because the men who create it undermine the foundation of sound business principles and only until such a time as their trade has been shown a better piece of goods produced in accordance with the policy of a full value for every dollar, can they hope to retain their yearly gallonage. (Applause).

The President: We have with us this morning, Mr. Fitch, field secretary of the California Manufacturers' Association. I wish Mr. Fitch would arise and let me introduce him. Mr. Fitch, field secretary of the Manufacturers' Association. We would be glad to hear a word from you, Mr. Fitch, if you have a word to say.

Mr. Fitch: If I will not be imposing upon your time?

The President: No, we are through with our program, just a minute, though?

Mr. Fitch: I will make it just a minute.

Mr. President, Mr. Secretary, members of the California and Southwestern States Ice Cream Manufacturers' Association, it gives me much pleasure to bring with me today the greetings of the board of directors of the California Manufacturers' Association, and trust that your deliberations here today will result in much good to your very worthy organization.

I just want to speak a word of the merits of organization. I feel very like the man in the selling business who was visiting the little city of Petaluma—a traveling salesman selling his line of goods—and he happened to meet an organization man, a man who was the repre-

Gone Forever

The days are past when business men follow methods or choose materials merely because custom has in the past decreed their use.

Today men judge only by the measure of performance or results.

It is these new standards of performance which have made the use of

Wyandotte Sanitary Cleaner and Cleanser

so almost universal throughout the ice cream industry.

And this result is only logical when you realize how efficient, dependable and uniform is the work of this economical cleaner; how easily it cleans; how harmless it is to hands and metal; how fresh, sweet, and wholesomely sanitary it leaves everything it cleans; and how many uses it has in the ice cream plant.

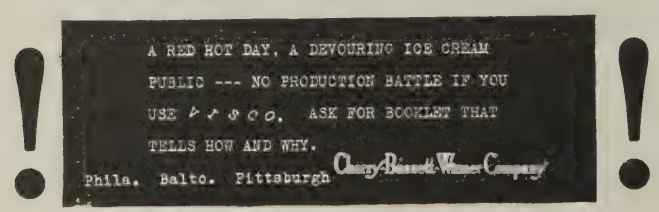
sentative like myself of a statewide organization. He said, "What line are you carrying, old man," a very natural question of a salesman to exchange the various felicitations of the day and of their various lines. "Why," he turned to the other man, "I am selling organization." The salesman looked at him for a minute and said, "I do not quite get that, will you explain the line you are selling?" "I am selling organization." He scratched his head for a moment and said, "I don't quite understand," so the man turned around and told him he was selling co-ordination of efforts. He was trying to bring certain lines of business throughout the state to recognize the need of standing together, fighting together for the principles of righteousness and justice in business. He gave him a few minute's talk and the man turned around and said. "I have sold lots of things in my life. I never knew it was necessary to sell organization."

There is just a little lesson in that to show you how necessary it is for the business interests, regardless of the activity, to stand together for those principles of business to make for good salesmanship and profit.

The meetings you have had here should result in a good deal of good for you. It establishes a cleaner relationship between the different members of your profession, it promotes the exchange of your ideas, and you should leave your convention feeling you have gained some good from it.



The State Association of Manufacturers is indeed very grateful for the splendid co-operation that has been extended to it by the members of the ice cream manufacturer's profession. It is one of 151 different lines of manufacturing activities that is now represented in the state-wide organization. The growth of this movement has been almost phenomenal. It is hard to believe that within two and a half years the California Manufacturers' Association has grown to be the fifth largest state association. We have memberships in 162 cities and towns in the state of California and the record that the State Association of Manufacturers made at the last state legislature is one that will not soon be forgotten by certain interests in the state of California who heretofore have very largely controlled our political destiny. It has resulted in a realization on the part of the business interests of the state of Calfiornia of the absolute necessity of co-ordination of effort in collaborating together in that we might protect the industries in our state government. As you probably know the state of California has been considered for years to be one of the most difficult states for manufacturers or business men to do business in, that the politicians had too close control; but today I believe that control has been broken up very largely. As long as we have a balance sheet; as long as one class is not permitted to control the policies of our state government, whether they be municipal or state, is a very serious problem, and when we organize the united industries of our state in our state-wide organization, it results in a balance sheet.

It might interest you to know in passing that the state legislature last year, or rather at the beginning of this year, that there were 73 industrial bills of an aggregate of 2,022, were introduced at our state legislature. That is, 500 more bills than any other state in the union had to contend with. Of the 73 bills, the State Association of Manufacturers in convention at Santa Barbara last February, near the first session of the legislature, decided to most vigorously oppose 68 out of the 73. That is, we determined that 68 of the 73 were partciularly dangerous to the future growth and expansion of industry in the state of California. It might interest you to know that we successfully killed outright, or in committee, 65 out of 68. It is perhaps the best legislative record that has ever been made by any one organization in the state of California.

Mr. Dryden: That included two bills that affected our industry.

Mr. Fitch: It was a complete surprise to the legislature to find that the business men of the state of California had organized to defend their interests. We established a lobby at Sacramento to which some 54 organizations contributed funds to their support, of which the California and Southwestern States Ice Cream Manufacturers' Association was one. I might explain that the work at Sacramento was conducted under the name of the California Industrial Council. The California Industrial Council is composed of 47 organizations of manufacturers in California,—that is, class organization such as your own organization, such as the Bottlers' Association, such as the Canners' League, etc., etc., and the bureau at Sacramento was known as the California Industrial Council, and it was fathered and looked out for by the State Association of Manufacturers.

There is just one thing I would like to mention in connection with the work at Sacramento, that is this: That in talking to the different legislators there were very much impressed—and I also say impressed with those of our staff who represented our organization at that city—with the fact that it was the first time in the history of the state of California that the manufacturers throughout the state had supplied sufficient data relative to the problems of industry. That is, had gathered statistics and facts relative to the different problems in the different types of industry so that when these bills came up for hearing it enabled the particular legislators whom we have elected to represent us to more intelligently study and analize our problems. Heretofore it has been left entirely to the State Federation of Labor to supply the legislators with the conditions regarding labor problems and the status of conditions in the different kinds of industry. I can best illustrate the point by the Synthetic Beverage bill in connection with the use of artificial flavoring. It was introduced by a Miss Barton, one of the two women elected at the state

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

Recognition of Gelatine

EACH day gelatine is receiving wider recognition for its pure food value. Dieticians readily admit that it is an aid to digestion; and housewives are using it more widely in the kitchen.

Used in the ice cream mix it serves not only as a stabilizer, but it makes the ice cream of finer texture and grain; and it aids in the digestion because it keeps the solids in the mix from separating and forming curds in the stomach.

Essex Gelatine is pure and tasteless. It is the result of twenty years of manufacturing experience and is used today by the leading ice cream manufacturers from the Atlantic to the Pacific. Shipments can be made from warehouses in Boston, New York, Philadelphia, Chicago, St. Louis and San Francisco.

MEMBER

Member of the Association of Ice Cream Supply Men

legislature of last year. Miss Barton felt she should return to the city of her birth having introduced some legislaion regardless of whether it was constructive or legislation regardless of whether it was constructive or prevent the use of a picture of fruits on a bottle of soft drinks or soda—for instance, it would kill orange ade unless orange ade actually contained some percentage of orange juice.

The members of the committee were absolutely uninformed as to the effects on the bottling industry. Prior to the meeting of the committee on this bill we made it our business to gather as many of the facts and statistics relative to the effect of this bill as we could; then we visited personally each legislator who composed that committee and tried to explain to him the effects of this bill. I remember Senator Scott, of San Francisco, told me after talking to me twenty or twenty-five minutes, he said, "Mr. Fitch, it is the first time I have ever known of any organized efforts to acquaint us with the facts of a particular piece of legislation." Heretofore you have left it to the State Federation of Labor to supply us with the facts and I want to thank you for the information you have given me and I will give it very careful consideration." The same effect resulted from each one of the members of the committee and with the result that the bill was killed in about fifteen minutes after the committee met.

I merely mention this to show what can be accomplished through organization, if you make the organization effective.

I want to say in closing that in the next two years you are going to find that the organized business interests of the manufacturers of the state of California are going to have much to do and to say with regard to the election of the representatives at the state legislature during the next two years. I would like to have the privilege provided that there are no press representatives in the room—the reason I make that statement is that I have something in my pocket I would like to read to you—confidentially—and I wish you would accept it as confidential. I would hate to see it get into the press, that is the reason I want to ask that quesion.

Mr. Dryden: I am familiar with this and I believe it should be read at our round table this afternoon because it is regarding our program before the legislature next year and outlines fully the policy of the California Manufacturers' Association, of which our organization is connected.

Mr. Fitch: Thank you very much. (Applause).

The President: Let me state further that if possible the various committees complete their work as soon as possible. Those committees are supposed to be prepared to make their reports this afternoon. We have run over our time a little, but the afternoon is not going to be very crowded and while they are supposed to come before the round table conference, we will be a little indulgent and if any of the committees have not had time to complete their work, please utilize all the time available and get them in as early as you can, but we we do want them before the round table closes. These reports should all be read either at the beginning or before we adjourn the round table which was supposed to close at 4:30. I think your committees know the composition of its own members. If not, inquire at the desk and you will get the information desired.

Are there any further announcements that need be made before we adjourn?

Mr. Wilson: Will you kindly announce the banquet tonight at 7 o'clock?

The President: The association itself is giving the banquet tonight—the same banquet hall as last night. Don't forget that you get your tickets from the com-

mittee in charge of the banquet, anyone of whom will accommodate you with regard to tickets—Mr. Alfred, Mr. Ball and Mr. O'Brien. Either one of these gentlemen. The tickets are $3.00.

The program calls for the announcement at the banquet of the results of the scoring of the ice cream and the medals will be awarded there. The prize winners and the medals, and the announcement of the election of the directors and officers will be announced at the banquet tonight.

I want to call your attention again to the fact that Mr. Kugler is all prepared that when we adjourn we proceed immediately to the roof garden where he has everything ready for taking the photograph of the entire delegation. It will only take a moment.

The supply men at great expense entertained us last night. Some of the supply men have exhibits at the dairy show and I think out of courtesy to these supply men we should all attend the dairy show sometime before we leave Stockton.

As I said, the afternoon is not very full and there will be an opportunity at different times in the afternoon and during the round table for further announcements.

On motion duly made and seconded, at 1:00 P. M., the session adjourned to meet again at the call of the president.

* * *

THIRD SESSION—December 6, 1921.
3:30 o'Clock P. M.

Meeting called to order by the president at 3:30 P. M.

The President: Before taking up the first order of business I want to read a telegram which came in during the morning from the East:

New Haven, Conn., Dec. 5, 1921.

President S. A. W. Carver,
Hotel Stockton, Stockton, Calif.

Congratulations and best wishes for success from the National to the convention of California and Southwestern States Ice Cream Manufacturers. May your deliberations and your efforts prove successful in bettering your membership in many ways and in helping to solve the problems which beset east and west alike.

CHARLES G. MORRIS, President.

The President: The first order of the afternoon's business is reports of committees. I do not know what committees are ready—the standing committees, probably none of them are ready to report. The judges will not be ready to report on the scoring for an hour or two, but will be ready before we are through our sessions, and that report will have to be put off until then. In view of that we will pass on to our this afternoon's business, which is the Round Table Conference.

* * *

Round Table Conference.

The President stated that the purpose of the "Round Table Conference" was to discuss any matters of interest that had not been brought before the convention during the other sessions.

Several matters of importance were discussed and the auditing committee reported that the statement of the financial condition was found to be correct, there being a cash balance of over two thousand dollars on hand.

While waiting for the report of the scoring committee, nominations for directors were made and while the tellers were counting the ballots the scores for the first three highest ice cream exhibits were read.

* * *

The President: It is suggested, and very properly, that we by vote express our appreciation of the committee of Prof. Turnbow, Mr. Alfred and the other members of the committee for the services they have rendered this

Nutting

Ice Cream Can Truck

Durable!

THIS rugged ice cream can truck will give you **years of service.** The frame is built like a steel bridge, of structural angle steel, strongly riveted and specially braced at the corners to withstand shocks. And it is rust-proof—entirely galvanized.

Easy Rolling. Ball bearing, swivel casters. Main wheels 8¼ inches high, with wide, smoothly machined flat face to save floors. Cold rolled steel axle, heavy axle boxes and collars.

The top can't sag. Rail around top, optional, holds all covers and keeps them with cans. Four wooden bars at the bottom fully protect cans from denting.

Keep your cans on wheels with these strong, light-running, durable Nutting Trucks. You can now buy them at the following

association in the matter of the time they have devoted in the service of this scoring contest. All in favor signify by the usual sign?

The vote was unanimous.

Mr. Miller: Up in Seattle several members requested me to state that they would be glad to come to our convention next year and join with us, and I am offering that as a suggestion. They have a very live organization in the Pacific Northwest, and they said, if we agreed, they would come if we would have the meeting either in Oakland or San Francisco, and I would like to give it to you. For this meeting they are willing to come and visit us in a body and I think they would make it their meeting—not to join the association, but that they wish to come down here and have a joint meeting, next year.

The President: Might we not safely leave that to our incoming board who will handle the arrangements for our next year's convention. As the time approaches they can arrange that meeting. That would look good to me.

Mr. Miller: I am perfectly willing.

The President: You have heard that expression from the Pacific Association ,that seems to be a matter of friendship extended to us that we cannot overlook, and I hope our new board will bear that in mind and take proper action to reciprocate and see if they can arrange a joint meeting. I suggest that the Secretary get in touch with the people of the Pacific Northwest on this matter.

At this time the tells had completed their count and the following were declared elected as the new Board of Directors:

R. J. Dryden, Oakland; C. J. Alfred, Los Angeles; H. R. Peacock, Bakersfield; L. W. Wilson, Fresno; S. A. W. Carver, Los Angeles; John Alsop, Phoenix, Ariz.; I. J. Trainor, Sacramento; L. J. Christopher, Los Angeles; F. H. Ames, San Francisco; E. W. Chism, Reno, Nev.; Geo. Platt, Los Angeles.

On motion duly seconded the meeting was declared adjourned and the new Board of Directors gathered for a five-minute executive session to elect new officers and to dispose of whatever business might come before it.

* * *

Executive Session.

The newly elected directors held a meeting immediately after the adjournment of the main session and elected the following officers: L. W. Wilson, Fresno, president; C. J. Alfred, Los Angeles, vice president; R. J. Dryden, Oakland, secretary-treasurer.

Social Session.

At exactly 8 P. M. the doors were opened and the large gathering surged into the banquet hall for the "social session" of the convention.

Mr. Dudley Dorman acted as master of ceremonies and introduced the newly elected president, Mr. L. W. Wilson, who expressed his appreciation for the honor which had been bestowed upon him. He voiced the hope that an active selling campaign could be inaugurated which would benefit the industry as a whole.

Mr. L. J. Christopher was next introduced as the first president of the association when it was organized to assist in entertaining the National Ice Cream Manufacturers' convention held in Los Angeles.

Mr. S. A. W. Carver, retiring president, spoke of the valuable assistance given the association by the supply men and dwelt on the early history and growth of the association from 12 members to 172 at the present time.

A reading, "The Dago Man at a Base Ball Game," was most interestingly rendered by Miss Alfred.

Vice President C. J. Alfred was introduced, after which Mr. Fitch, field secretary, California Manufacturers' Association, spoke about the industrial growth of the state.

Mr. Jacobson spoke in behalf of the supply men, and Sam H. Green spoke for the California Dairy Council, urging "quality of product." Mr. Green also made the presentation of the medals to the winners of the ice cream contest. Among others who were introduced were Mrs. F. E. Miller, Jay Kugler, C. O. Swanberg and L. J. Christopher, who told of meeting Marshal Foch and he reported the great general as saying, "it was not fighting, but co-operation that won the great war."

All present very much appreciated the high class entertainment rendered by the Hiram Claire troupe, who were playing in the Columbia Theater.

The gathering formally broke up about midnight and California's greatest convention was a matter of history.

Putting Selling Among Professions

Members of Salesmen's Club Interested In Betterment of Their Calling

IS salesmanship a profession?

The first profession recognized by society was that of the clergy, centuries ago. Next came the profession of the law. It is only within comparatively recent generations that medicine reached entire recognition as a profession. Dentistry acquired a similar distinction only during the last century. Architecture, teaching—there are those even now who hesitate to regard these vocations as true professions.

Is salesmanship in this present generation going to enter the scanty number of professions also?

This is a question that has interested many salesmen in recent years. Through the last confidential bulletin of their Salesmen's Club, more than 500 sales representatives of member companies of The Association of Ice Cream Supply Men have focussed their attention on this same thought. By permission of the Club some extracts from this last bulletin, significant along these lines and of equal interest to ice cream manufacturers, are repeated here:

"Every salesman on the road, no matter what he sells, is helping write the commercial and economic history of the world. Now salesmen sufficiently realize this. The machinery of the world's business is so vast today that the biggest salesman ever born could not be more than a tiny cog. But although it is vast the world's machinery for doing business—for making goods and selling them, in other words—is also delicate and almost incomprehensibly complex.

"George E. Roberts, an economist, told the Export Managers Club in New York recently something along this line. It applies in greater or lesser degree to every salesman everywhere, no matter what his goods nor who his buyers.

"Russia,' he said, 'was one of the great tea drinking countries of the world; India was one of the great ten producers. The war stopped Russia from tea drinking, and India couldn't sell her tea. India is a great cotton wearing country, but if she couldn't sell her tea, she couldn't buy cotton, so the mills of Manchester shut down. If England's mills were not running, our Southern farmers could not sell their cotton, and they, in turn, shut down on buying. What is true of tea and cotton is true in a greater or lesser degree of the hundreds and thousands of things that make up our daily life. The Australian market for shoes affects the mill towns of New England, and the fashion in stockings in Argentina is reflected in the payroll of a Philadelphia worker.'

What one salesman does concerns a hundred thousand other men. Perhaps it seems to affect them infinitesimally, but the salesman must never forget that it does concern them just the same, and that a true knowledge of economic facts and a true conception of the duty of a salesman to play fair, react each day on the lives of countless unseen men and women."

To many a salesman active and successful today, who began his work around the first of the century, these other extracts from the same bulletin must be particularly interesting.

"Newspaper paragraphers ask every day, 'Where is the old-fashioned girl who wore so-and-so-and-so-and-so,' and 'What has become of the old-fashioned man who did this-and-that-and-the-other-thing?'

"That is the newspaper humorists' way of saying, 'A good old custom has departed. A type that once was known to everyone is now no more. Let's write a finis to a chapter of our manners and development.'

"Twenty-three years ago a man named William J. Kountz, Jr., wrote some advertising-and-selling skits, or essays on life as it was lived those days—'Billy Baxter's Letters.' They described a certain phase of commercial and selling life of twenty three years ago as uniquely and as vividly as the 'Dere Mable' letters of four years ago described the life of a recruit in the great war.

"For his own racy style Kountz' Billy Baxter' letters are alone worth reading. A small idea may be gained from the following sentence describing the author's departure late one night from a characteristic salesman's evening of conviviality: 'I guess the wind must have been against me, as I was tacking.'

" 'Billy Baxter's' days are gone. There was a day when 600,000 copies of Kountz's essays were in circulation in the country in a few months. They were contemporary classics, true to life.

"What has become of the 'Billy Baxters'?—The answer is: Consider the development of Salesmanship!

"Do you realize the great competitive changes, and the great changes in procedure and habits that American salesmanship has undergone in the last generation? Do you realize that every day today is seeing the salesman's work brought nearer and nearer to a professional status?

"Do you realize that, more and more, salesmanship is a study—analysis—the demonstrating of quality—that salesmanship is a serious science."

At present low prices for retinning Ice Cream Cans you can make a very decided savings over the purchase of new cans.

Take advantage of this service, have your rusty cans retinned instead of junking them and buying new cans.

Our price for retinning a five gallon Ice Cream Can is seventy-five cents and ten cents for Covers—about one third the cost of a new can.

Use your old crates in shipping us your rusty cans. Just mark your tags—

NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from page 46)

October 11, 1922,—Morning Session.

The meeting convened at 10:20 a. m., President Martin, presiding.

President Martin: Dr. Van Norman, President of the National Dairy Congress, will address us.

* * *

WORLD'S DAIRY CONGRESS.

By Dr. H. E. Van Norman.

Mr. President and Members of the National Association of Ice Cream Manufacturers: This gathering of yours is an illustration of one of the remarkable things that have been going on in the dairy industry for the years that I have known it. I remember when the ice cream man considered that he was in a secret business and the effort was to keep everything connected with it a secret. Today we have progressed to the period when not only is that not true, but you gather and discuss your most intimate problems, while possibly your bitterest competitor is sitting just back of you or in front of you. That illustrates the change that has been going on in the dairy industry.

I remember when the milk dealers first met. I was temporary secretary for half an hour when the International Milk Dealers' Association was formed and they adopted the plan of having one dealer from each town so that they wouldn't give away their trade secrets to their competitor. Today they have thrown their doors open to any man who is an honorable member of the profession and he is entitled to become a member of the Association. That same thing is true of all branches of business, I think. We have discovered that after we have told all we know to our competitor, and after he has told us all he knows, the ultimate place that any concern occupies in the industry is based primarily on the brains and ability within that particular institution and not on some unholy advantage which one concern has over the other.

Now we have come to the point where we are not satisfied to gather nationally, but the question is, "Shall we gather internationally?" The suggestion for an international gathering came to us from a South American country. Representatives of the different branches of the industry gathered together and decided that an international gathering of all the interests built on the cow and her products would be worth while, and Congress has authorized the President of the United States to issue an invitation to the world to gather in the United States in 1923 for an exchange of knowledge.

Europe gave us our four breeds of dairy cattle. She gave us the separator, and the homogenizer; she gave us the cow test association; she gave us a lot of our fundamental knowledge of the feeding of cattle, of the handling of dairy products. America accepted all these and has gone ahead and developed not only these things, but also the great manufacturing organizations and other business organizations, and the art of creating business. I think that is peculiarly an American institution. We have developed the great city milk distributing industry. Hoover said in no city of Europe do the common people get such milk as they do in America. In no cities of the world do people get ice cream as in America. And now science has shown us that in milk products we have something which every growing child needs and it is becoming a national problem to teach the

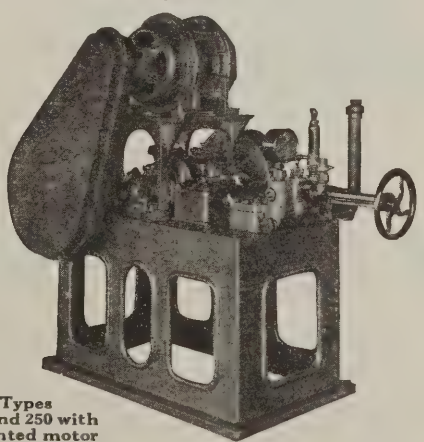
growing child how to consume the amount of dairy products which it ought to have for its own welfare.

An examination of 52,000 school children in the city of Los Angeles showed that the children who drink milk are farther along in school for their age than the children who don't drink milk, so much so that the former children complete the eighth grade of the grammar school two and a fraction years younger than the non-milk drinking children.



The week's campaign carried on in the neighboring state of Wisconsin showed an increased consumption of milk, butter, cheese and ice cream of from twenty-two to thirty-two per cent as a result of educating the people as to the relation of these products to the health of the community.

A merchant prince of China said, "If you will establish an agricultural department and teach our department dairying and agriculture, I will finance it." And a representative of that school was at the University of California a few months ago to find a dairy instructor to take over to teach the people of China how to produce dairy products, because the thoughful minds of China are recognizing the need of milk products in their diet. In Hongkong, China, they are manufacturing ice cream out of sweet butter and cream imported from New Zealand and into China, and are using American machinery. In Tokio, Japan, they are distributing milk that has been bottled and pasteurized with American machinery. London, England, is putting in the largest milk plant in the world, all American made machinery.

Now I speak of these things to show you the international position into which this country is getting, not only in politics, not only in finance, but in the dairy industry as well.

See Other Advertisement for Lists of Sales Branches

Now, then, the same is true of dairy products. When America has a surplus or New Zealand has a surplus, or the world has a surplus of dairy products, the price goes down. When the world has a shortage of dairy products the price goes up. When we created a new demand for condensed milk by the war, not only did the price of condensed milk go up, but all other dairy products went up, and when that increased demand suddenly stopped and the condensed milk was thrown back on our country and other countries, the price of condensed milk went down, but the price of all other dairy products went down, too. In other words, the ice cream industry is intimately related to butter, cheese and milk, and the industry of America is intimately related to the industry of all other countries of the world.

The ambassador from Argentina has said that he doesn't care whether the farmers of Argentina raise steers or cows, but he does care whether the children drink more milk and eat more butter and ice cream. Therefore, he is putting into Spanish some of our American literature on the relation of dairy products to human welfare and sending it down to his country in order that his people may learn to eat more dairy products.

I should like to impress upon you some of the possibilities of this Dairy Congress. Supposing we can bring to this country one or two big men from China, an Indian prince or two, people from France, Germany, Switzerland and Spain and all these different countries. It is no particular news for your paper when Bill Brown comes up here from Texas to see your ice cream plant, but when some of these famous people from Europe come over here to learn how to produce dairy products for their children, that is news for the Associated Press. If we can have a string of visitors coming here to study our plant and we can use them for the publicity whi we can get for the dairy industry, is it not possible th we can give the American press a little better appreci tion of the importance of the dairy industry to the w fare of our cities? One of the troubles th we are up against is the fact that these city edito don't have time nor take time to learn the relation our business to their business and sometimes they sta off on fool campaigns which some of us resent. Wh they need is education. Now they may not listen you when you live in their town, but when a man w come from way around the world to find what y are doing in your town, the editor may sit up and wa to know why he comes over here.

Now some of you may be afraid that they will lea much more from us than we will learn from them. am not a bit afraid of that, any more than you a afraid, when you come to this convention, that you w tell somebody more about your business than you lea from him about his business. The spirit of progress t day is give of what you have and get in return from t other fellow what he has that will help you; and that just as true locally and nationally as it is international

Now in order to make this Congress possible, it w suggested that we find a committee of a hundred m who would put in a thousand dollars each, and the U versity of California has given me leave of absence promote it. I have $64,000. The second man I met t morning handed me his acceptance and check for part. I didn't have time to go out and call on all you, so I picked out about ten of the most publ spirited men I could learn of in the industry and vited them to act on this committee, and the same in t butter business, and the Jersey and Holstein busine These men are invited to meet to-morrow evening a quarter to six at the St. Paul Athletic Club to form organization to take charge of the plans for this Worl Dairy Congress, and there will be proposed at that me ing a plan by which the President of your Associat shall become a member of the Board of Directors of t organization which will handle this Dairy Congress.

Therefore, I will close my remarks by inviting fi your Association, as such, to become a member of t World's Dairy Congress organization and make its c tribution to the support of the work, and then to inv each and every one of you (if you are not in the th sand dollar class maybe you are in the seven hund and fifty or the five hundred or the two hundred a fifty dollar class) to make your contribution to the s port of this enterprise and put your name in the lite ture which will go around the world in connection w it. Why? Not because you are going to export cream—no, but because if this Congress fulfills its p pose, if it helps the farmer to have healthier cows better cows, if it helps to get better raw material, i helps you in some of your problems, it helps the wh industry and each of you gets your share of that g eral prosperity that results from a worldwide move. Y will never be able to look in your ledger and put y finger on that fourth line and say, "That is the divid that came from the World's Dairy Congress." It w be like the Babcock test, and yet you couldn't do b ness without the Babcock test, and so on with all th other results of scientific research. They help us m than we are conscious of. The belief of the leaders the industry is that an International Dairy Congr held in this country in 1923 at the same time and pl as the National Dairy Show, bringing to us the best t each country has, getting in return what we have, wil

A Valuable Impression

A pleasing impression upon customers is of value. You can create one and at the same time save your goods from damage by spreading sheets of **TANGLEFOOT** in your show windows, especially over Sunday.

TANGLEFOOT will then be at work for you and will not only catch the flies, but attract the attention of people who pass your store to your efforts to keep your stock clean and fresh, and create in them a desire to use **TANGLEFOOT** themselves. This means extra sales to you. For 1922 **TANGLEFOOT** has been reduced 60 cents per case. This will allow you to sell at the old price, two double sheets for 5 cents, and make a profit of 50 per cent.

Remember **TANGLEFOOT** *catches the germ as well as the fly, and that poisons, traps or powders cannot do it.*

of benefit to every man who has a dollar invested in an branch of the dairy business. I thank you.

President Martin: I think we all appreciate th message Mr. Van Norman has brought us.

The next on our program is an address, by Dr. E. Williams, Washington, D. C., Dairy Manufacturin Specialist, U. S. Department of Agriculture.

"Progress in Studying Causes of Sandy Ice Cream, By Dr. O. E. Williams.

The subject assigned to me, "Progress in Studyin Causes of Sandy Ice Cream," was assigned by Mr. Lo wenstein about the middle of July or August. I r gretted at the time he didn't ask us to talk on some the work we have done lately in the laboratories, stud ing the effects of the proportion of the ingredients Ice Cream, something you manufacturers would be f more interested in than you are in sandy Ice Cream, b cause I believe most of you at the present time ha your minds fairly well made up as to what really co stitutes sandy ice cream and how to avoid it.

Most of this work that I have written up was do about two years ago and we followed that up by so very technical work which is still under progress an which we hope to have available later.

I will read to you a brief of the results that we ha obtained in a practical way in the laboratory on t causes for sandy ice cream.

Sandy ice cream has given the ice cream manufa turers and dealers a great deal of trouble in recent year and the growth of the industry may have been retarde considerably by this difficulty. For the benefit of tho who may not be familiar with sandy ice cream, I wi first explain the nature of it in a general way.

Ice cream is called sandy when it has something in that resembles, to the sense of touch, very fine sa (hence the name), and which does not dissolve readi in the mouth. The kind and degree of sandiness varie At times the sandy particles are coarse, and not ve numerous; at other times they are exceedingly fine a numerous. The latter type is the kind of sandiness th is ordinarily met with, but both the large and small pa ticles cause the ice cream to be objectionable. When t particles exist in small numbers, they may not be ve troublesome; on the other hand, when they exist large quantities, the ice cream becomes decidedly u marketable. Some manufacturers claim to have had hu dreds of gallons of ice cream turn sandy before it has le the factory, but sandiness is usually found to occur much smaller quantities of ice cream after it is delivere to the dealers.

The irregularity in the size of the particles and in t occurrence of the trouble has been mystifying not onl to the manufacturers but to many other men as well. T quote the words of two large progressive manufacturer who have been in the business for a long time, one r cently said: "For a while we thought sandiness w probably due to the fact that the cream was held in t hardening room for a longer period, but upon closer i vestigation we discovered that that was not the cau as samples that were held only a few days would tu sandy during the winter months, or between October and April 1. I am just as far from having a definit solution as I ever was. It seems to come and go like ghost in the night."

The other one said, "We got the professors from t colleges and took them into our own laboratories, an they took samples of our goods, and took them into the laboratories. We had eight weeks of that sandy cond

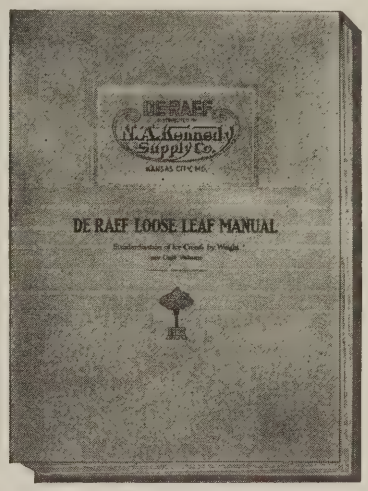
tion, and it went just as it came, and we were no wiser after it left than we were before. We changed no conditions whatever."

Since the sandiness occurred without any apparent change in the kind and quality of the ingredients used, or change in the conditions of manufacturing, it has naturally been a puzzling matter. The origin of sandy ice cream, therefore, has been almost as bewildering to the manufacturer of ice cream as the causes of fishy flavors in butter have been to the creameryman.

The first time our attention was called to this difficulty was about eight years ago. That was a very bad case and as we did not hear of any similiar experience no investigations of an extended nature were made. Then about five years later, we heard of several other cases of sandiness; consequently a preliminary investigation was started. This also consisted of superficial experiments. We soon found it necessary, however, to make a fundamental study of both the character and the causes of the so-called sand, and as we shall see, the results of this investigation have so far been positive as to identity and partially positive in regard to the causes.

Identification.

Now the first question is, what is this sandy material? The answer is, milk sugar, or as it is technically called, lactose. This fact has been definitely proven and explained by Mr. H. F. Zoller and myself in a recent article entitled, "Sandy Crystals in Ice Cream, Their Separation and Identification," which appeared originally in the last number (August 15) of the Journal of Agricultural Research. A separate of this article from the Journal has been sent to all of the members of the National Association of Ice Cream Manufacturers, so I presume most of you are already informed about the identity of this sandy material.



In case you have not received a separate of this article, you will find a copy of it printed in the September number of the Ice Cream Trade Journal, and the October number of the Creamery and Milk Plant Monthly, and perhaps also in some of the other trade journals.

Causes of Sandy Ice Cream.

The next question is, what causes the lactose crystals to appear in ice cream? This question is not easy to answer definitely because there are many conditions on which it may depend. For instance, the amount of lactose in the mix; the amount of water present; the form in which the lactose exists, the presence of other solids; the temperature and its changes; and the time of holding, are all important conditions. There are also various theoretical factors that it may be necessary to take into consideration in determining the real cause of sandiness in ice cream.

So far, no one has secured sufficient data to show conclusively the significance of certain factors such as the rate of freezing and the protein content on the crystallization of lactose in ice cream, or to tell what the physical constants of ice cream mixes of varying compositions are. In fact, the only work that can be taken into consideration, relative to the determination of physical constants, and bearing on the manufacture of ice cream, is that of Mr. S. C. Hudson. His results are published in the Journal of American Chemical Society, volume 26, 1904, and volume 30, 1908. This work includes the determination of the freezing points, and the rate of crystallization, etc., of pure lactose solutions. Work is now being done on the freezing points of different ice cream mixes in two of our laboratories, and

the results will soon be available. The fundamental causes of sandy ice cream can not be discussed, therefore, until we know more about these underlying principles.

From studying the conditions in a general way, however, we have found three major conditions to which sandy ice cream may frequently be attributed; namely, first, sandy condensed and evaporated milk; second, excessive lactose in the mixes; and third, fluctuation of temperatures in the hardening rooms and cabinets.

In explaining these three general causes, it will be best to use the following outline of the general conditions studied:

1. The character of the milk products used in the manufacture of ice cream.

2. The composition of ice cream mixes and the methods of compounding.

3. The treatment of the mixes prior to freezing.

4. The degree and rate of freezing and hardening in the ice cream.

5. The temperature at which the ice cream is held while being marketed.

6. The length of time the ice cream is held.

General Condition No. 1.

In the use of materials containing lactose crystals we find the easiest and simplest way to produce sandy ice cream. It is well known that condensed and evaporated milk are commonly used and that both of these products are often sandy. The sand or crystallized lactose found in condensed milk is about one-tenth as soluble as cane sugar, hence when milk of this character is used there is danger of the crystals of lactose not being completely dissolved, and if they are not completely dissolved a sandy ice cream is formed.

General Condition No. 2.

In the composition of the mix there is another very common source of sandiness—the excessive use of milk solids not fat. Most of us know that in a large number of factories there is very little attention given to standardizing, and that the methods of calculating and assembling the ingredients are often crude. This, of course, is one reason why a great deal of variation occurs in the texture and composition of ice cream. It is also a reason for ice cream becoming sandy. According to the results we obtained last winter, we found that ice cream subject to exposure, as most ice cream is during the process of marketing, should not exceed 5.85 per cent of lactose calculated on the entire mix. This is equivalent to about 11 per cent milk solids not fat. Naturally, therefore, in all cases where milk solids not fat are carelessly substituted for a considerable part of the fat there is likelihood of getting too much lactose in the mix, which under certain conditions may result in a sandy ice cream. The conditions favorable to this result are explained later. In many cases an unusual amount of lactose is secured by taking the sand from the bottom of a can or barrel of sandy condensed or evaporated milk; the result of this is bound to be a sandy ice cream. Under the best conditions it is possible to use 12 per cent of milk solids not fat, but greater quantities are sure to bring trouble. If there is any doubt about sandy ice cream being produced in this way, just try to keep ice cream containing say 13 per cent of milk solids not fat for a week or ten days in any ordinary ice cream cabinet, and see what happens.

General Condition No. 3.

Under the third heading, treatment of the mix prior to freezing, there is a condition that is very important, namely, pasteurization. As stated before, in utilizing sandy condensed and evaporated milk the ice cream will be sandy if the crystallized lactose is not all dissolved. This danger we find can be overcome if the ice cream mix is pasteurized to 145 degrees F., held and kept slowly agitated for 25 minutes.

General Condition No. 4.

The fourth condition, that is, the degree and rate of freezing and hardening the ice cream is something we know very little about. We have not had facilities in the Dairy Division to properly study the effect of rapid freezing and hardening on a large scale, but we have made a few experiments on a small scale and find that the rapid freezing of mixes having a high lactose content hastens the formation of lactose crystals.

General Condition No. 5.

The temperature at which the ice cream is held after it is once hardened is undoubtedly one cause of much of our sandy ice cream. In our preliminary experiments we soon found that heat shocking, or the raising and lowering of the temperature, was conducive to the crystallization of the lactose in ice cream. This is the condition that commonly occurs in ice cream cabinets and

Degree of Sandiness Observed Under Different Temperature Variations.

Mix No.	Per cent of lactose in mix	Method of storing for four days: Hardening room 0°—5°F.	Cabinet (normal) 6°—10°F.	Cabinet (abnormal) 6°—17°F.
1	3.33	None	None	Slight
2	6.65	None	Trace	Bad
3	8.85	Trace	Considerable	Very bad

The milk solids not fat in the above experiment were obtained from a good quality of evaporated milk. The ice cream was held in the same cabinet in duplicate quantities, one set of cans being taken out each day and the ice cream being allowed to warm up to 17 degrees F., prior to repacking with ice and salt. This experiment was made several times, with the same results each time. Whenever the temperature fluctuated the lactose crystals formed, and increased in quantity and size with the percentage of lactose in the mix. This experiment also substantiates what was said about the composition of the ice cream mix.

General Condition No. 6.

Holding ice cream a long time, especially when subject to wide changes in temperature, has proven to be favorable to the formation of sandy ice cream. The time required to produce sand will vary with the concentration of the lactose in the mix and with the amount of changing in the temperature, or of heat shocking. This is illustrated by the large number of instances where the dealers who handle the least ice cream are usually the first to complain of having it sandy.

Dr. Williams gave the following explanation of the charts mentioned in his paper.

The top one is the composition of the ice cream mixes that were used in these experiments. This experiment was repeated several times for the benefit of demonstrators or the people that happened to be visiting in Washington, and while the terms are only relative, I am absolutely certain you can duplicate the results very easily, and I might say that very good condensed milk was used in this case. You will notice the variation in the three mixes expressed in milk solids not fat. They vary from approximately 6%. These two mixes, No. 2 and 3, have additional milk solids not fat added to them, to substitute for the fat that has been taken out of the mix.

Now in those cases you will find carried down here the percentage of lactose shown approximately. These ice creams were only exposed for four days. Ordinarily we get it in a week or ten days if you give it favorable conditions for development.

Some people say that you cannot get a sand developed from ice cream that has not added to it additional milk solids not fat.

Here are three samples exposed—one kept in the hardening room in practically ideal conditions, you might say, the others in normal cabinet conditions and abnormal cabinet conditions. One set of cans was taken out each day and allowed to warm up to 17 degrees F. We got in our normal ice cream a slight indication of sandiness. I had that occurring last summer. I made up samples to demonstrate to some new chemists that came into our department the effects of different percentages of ice cream on the desirability. We had a sample of this ice cream in the cabinet that was about three days old; the mix had been held for about five days and we had a distinct sandiness occurring in that normal ice cream.

Now in No. 2, you will find about the normal amount of milk solids not fat that is commonly used. We find that in the cabinet developing just a trace. These mixes were made, as I recall now, with a temperature of about zero. That is a little too cold for ideal conditions of freezing. We got traces in that case. Probably if the temperature had been higher, we might not have gotten that, but at any rate in these two samples it showed up very nicely, a trace in the one that hadn't been taken out and exposed to heat shocking and bad in the one that was exposed.

Now the other one was an extreme case. This was made up primarily for an experiment in connection with utilization of saccharin to show whether or not saccharin could be the entire sucrose, or cane sugar in the milk could be used by the use of saccharin. We tried to make a product testing 18% milk solids not fat so as to give it body. We found that if you make it one day the next day it would be beautiful but the fourth day it would be so sandy that there would be no doubt about it being unmarketable, so I reduced it to 16%, and in keeping i

only four days we found that there was trace here even in the hardening room. Some people say you can't get it there. I believe with ideal temperatures, even if you are using high percentages, that you could get by with it if necessary and if it was disposed of rapidly. We got very considerable under the ordinary cabinet condition. With this other sample, Mr. Young and his directors in their ice cream factory were having considerable difficulty and there was no doubt in their mind as to its being very bad, so I marked it that way, but you see the fact there of not only the variation of temperature but in the variation in the percentage of lactose which rather verifies what I said before on the second topic in regard to the mix, that you have to keep within a certain range of milk solids not fat to avoid that difficulty.

I want to call your attention to anther photograph here. If you have not already seen it illustrated in the separate journals that were sent to you, you can see it here. The crystals are sort of a tomahawk shape and they are very irritating to the membranes of the mouth. Some contend that the sand might originate from the sucrose present, but that is not true. These lactose crystals were multiplied 315 times. They were not taken from ice cream but from whey, where the crystals are more ideal in their conformation. You can examine this after the meeting.

I will be very glad to answer any questions as far as I am able.

* * *

President Martin: Dr. Williams nas brought a wonderful subject here; we are all interested vitally and I would like to see it very thoroughly discussed.

Mr. Allen D. Cunningham: I would like to ask Dr. Williams if he has made any experiments in concentrating the milk; if he has found that after he has gone over a certain amount of concentration the crystals show up in his ice cream.

Dr. Williams: You mean in concentrating the ice cream mix?

Mr. Allen D. Cunningham: We find that we have trouble usually when we run too high on concentration of milk. We have a little crystallization when we hold it too long in our hardening room, it is more of the crystallization of the water, a separation of the different products in it, but the sharp crystals come out more when we use too high concentration. We have it in two and seven-tenths.

Dr. Williams: Several manufacturers called my attention to the fact that they have been unable to use the five to one concentration of plain condensed skim, primarily due to the crystallization of the lactose in holding that for ice cream purposes, and, of course, the heavier the concentration is, the greater the crystals are bound to be because there is less water there to dissolve those crystals. As a matter of fact, I suppose the lactose exists in condensed milk in the crystalline form only we are not able to detect it. The small crystals will become large if they are given proper conditions under which to grow. In regard to concentration two to one, I have never had that difficulty. We usually make ours around three to one. I find that is very satisfactory. Of course, the way you handle your condensed in the pan may have something to do with it. Those are some phases of it which I have not been able to study very thoroughly but I don't think you ought to be troubled with two to one concentration in condensed milk in ice cream.

Mr. Allan D. Cunningham: Two and seven-tenths.

Dr. Williams: That is practically three to one; that

is what we use most of the time and we haven't had any trouble. I haven't had an opportunity to study the factory conditions, only had reports here and there and the observations I have made in Washington factories which are, as a rule, typical of most plants. They were troubled with condensed milk which was condensed five to one and four to one, so they had to reduce that to three to one.

Mr. Peale: In your remarks you referred to evaporated milk and condensed milk. Is this condition not possible with powdered milk.

Dr. Williams: Yes, I have used several grades of powdered milk making it up into condensed milk beforehand and I think I can duplicate those results with powdered milk the same as with condensed milk.

Member: I would like to ask Dr. Williams if they have studied the effect of the action of protective colloids such as gelatine, etc. Do they stop the precipitation at all?

Dr. Williams: We are not exactly prepared to answer that now. We are doing some work along these lines, have done considerable already, but the results have been conflicting. Milk solids not fat are natural colloids, and protein solids are a colloidal substance and act as a protective colloid, but the influence of these we are not able to determine so far. We can recognize the fact that colloids have a protective action but how much we don't know definitely.

Mr. John T. Cunningham: Dr. Williams, would you assume that the condition of the milk (I am assuming that the milk solids have all to do with what we are talking about now) before it is concentrated, that is as to its acidity, had a lot to do with this precipitation of lactose?

Dr. Williams: That has a bearing on the question just asked. You realize that milk varies in composition at different periods of the year. The casein may vary as much as one per cent. Realizing that, I wrote several of the men whom I thought had had trouble with sandy ice cream and some reported that they had more of it occurring in the winter months than they had in the summer months; but on the other hand, there is this condition arising there that interferes with drawing a conclusion, that is, that your ice cream doesn't turn over as rapidly in the winter months, and we do not know whether it is a condition of the milk or a condition of the handling.

Mr. John T. Cunningham: I appreciate the difference between October and April and so do all the ice cream manufacturers, but could you tell us anything about the condition of the raw milk before it is concentrated? Would its acidity have a great deal to do with the precipitation of this lactose that we are speaking about now? Do you know anything about that?

Dr. Williams: My personal opinion is that it would have, but I could not cite any specific data on that. It only seems possible that if the milk varies, when you concentrate you intensify that variation, which would be noticeable when it appears in the ice cream.

Mr. Luick: We found at our creamery, when the milk in the spring of the year showed excessive acidity, it immediately began to precipitate the sugared milk or lactose and on making tests and eliminating that high acidity we immediately lost this precipitation of crystals.

I would say to anybody having trouble with sandy ice cream to just reduce milk solids to not more than say twelve per cent, and don't concentrate your condensed milk, whether you are making it by pan or with the concentrator, to much more than two and three quarts

Hard Usage Shows on the Bottom First:-

The bottom of every ice cream tub displays a splendid fight to retain its position, but — once a single stave has conspired against it — once a single stave begins to mutiny and pull away from the heart of the tub — the bottom — then everything goes and goes like the "Wonderful One Hoss Shah."

But not so with tubs protected with the

to one. Stay close under three to one and I don't think you will have a particle of trouble.

We had considerable trouble with sandy ice cream a year ago and after giving the matter considerable study and thought, not from the scientific standpoint but from the practical standpoint, we found if we held our concentrated milk down to three to one or under and were careful on the platform not to accept any milk that was a little high in acidity, we had no trouble.

Mr. Allan Cunningham: I would like to ask Dr. Williams if twenty-seven per cent total solids or over twenty-five per cent in your concentrated milk would be too much? That is about three to one concentration. We found that we had trouble after we went over twenty-five per cent total solids.

Dr. Williams: As I tried to bring out in that chart, you may get sandy ice cream from just normal ice cream; it may be due to the method of handling the ice cream. You cannot keep ice cream under varying conditions because you have constant changes going on that do not re-establish themselves. They go so far and bring another heat shock and you continually add to that trouble; if you keep it for a couple of weeks you get into serious difficulty with ice cream that only contains a normal amount of lactose and I wouldn't say that the difficulty could be attributed entirely to the condensed milk. I think if you use condensed milk that has been properly made and contains twenty-seven per cent total solids, you ought not to have any difficulty at all.

Mr. John T. Cunningham: Would the active superheating of condensed milk have any bearing on that question?

Dr. Williams: I haven't studied that but I visited several factories that use nothing but superheated condensed milk and heavy solids, and they have yet to find any sandy ice cream. However, they have ideal conditions for keeping it, so I suppose it hasn't had an opportunity to develop.

Mr. John T. Cunningham: We did have a lot of trouble with sandy ice cream a while ago. I think, gentlemen, of all the distressing things nothing is worse than getting out a lot of sandy ice cream and scattering it over your trade. I believe it is a worse condition than getting out a batch of sour ice cream, and either one is bad enough. This was several years ago as I remember it, and we took it up with the people at the creamery where the condensed milk was made. I am still assuming, Dr. Williams, that the fundamental trouble is with the condensed milk. We had a heart-to-heart talk with the creamery people and laid down our theory. They took the advice that we gave them and we haven't had a trace of trouble since that time and I think that was two or three years ago.

I advised the creamery people not to go over 260 pounds of milk in the spring of the year. It seems to us that with summer milk you can run to 300 pounds condensation if you wish. Of course, you get more milk solids. That is our experience.

Dr. Williams: I have had trouble many times by taking the milk some days from the condensed milk can and at night setting it in the refrigerator in a little water and letting the water run all night without agitating it, and then make ice cream out of that without pasteurizing it; I would have some sandy ice cream.

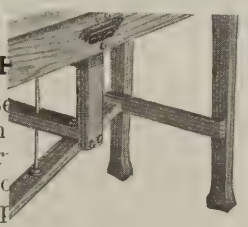
Mr. Lide: If you store condensed milk, sugared milk, and make it as high as the government standard, forty and thirty, you will certainly get it.

Dr. Williams: In my second classification in the studies that we made I mentioned pasteurization. I

hink everybody ought to recognize the essentials of pas-eurization, not only from the bacteriological standpoint ut from the amelioration of the mix, getting into uni-orm condition, and if you pasteurize sandy condensed nilk properly and have the proper concentration in your nix of lactose, you ought not to have any difficulty.

Mr. McDonald: Dr. Williams, after you already have his crystallized lactose, can it be put back into solution?

Dr. Williams: You pasteurize it. I would say it is not the best plan to work that stuff up as you would have to take it out of the cabinet and you might have a little metallic flavor after that. If you pasteurize it properly you wouldn't have any difficulty dissolving your crystals. To invert lactose you have to heat it in the neighborhood of 140 for about thirty minutes. It would be safe to heat it to 145.



Mr. Wright: We have made condensed milk ice cream mix and also ice cream. The first sandy experience we ever had was when we were making superheated condensed milk and we found that was caused by holding the condensed milk at too low a temperature. We experimented with that quite a lot. You hold it to almost freezing temperature and you will get sand every time. Another experience we found, as Mr. Cunningham says, condensed milk made from milk of too high acidity will make sandy ice cream, if it is only condensed two to one or even less. We have had that in ice cream mix condensed two to one which is caused by too much acidity in the milk.

Another thing that will make sandy ice cream is cooling your condensed milk too fast. All people who manufacture sweetened condensed milk know you can't cool it very rapidly. If you do, you will have sandy sweetened condensed.

Quality and Prices always right.

HOW MUCH DOES A NAME HAVE TO DO WITH A BUSINESS?

We have always maintained that a man's name, in some mysterious way, represented some quality—or otherwise—of the product which he manufactured or sold. We looked over the situation recently and found that the ice cream manufacturers certainly do not live up to their names anyway.

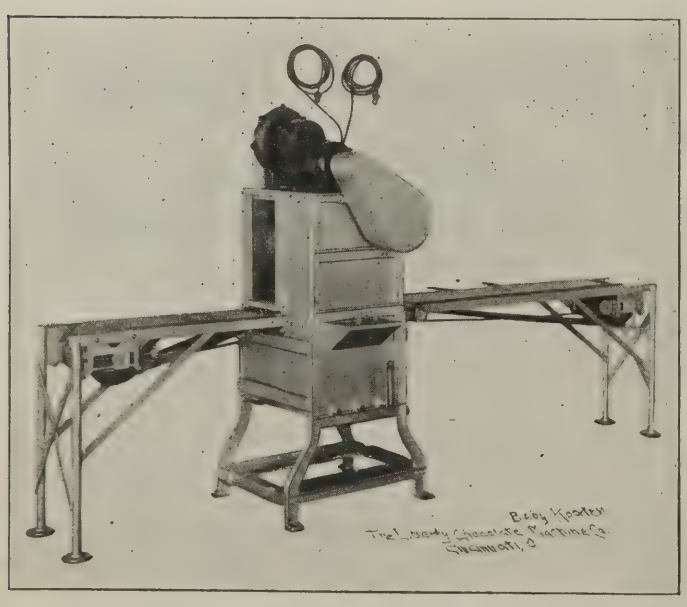
For instance, we stopped at a town in the middle west to try some of Bob Baker's ice cream and found that it was not baked at all but frozen, and frozen hard.

Next we were victims of Holliday Ice Cream. We couldn't afford to stay in town until Sunday so we ate it on an ordinary week day and were genuinely surprised to find that we remained in perfectly good health.

Traveling south we found what we then considered a really outrageous sign—"Sloppy Ice Cream For Sale Here"—on the show window of a candy shop. Thinking that we had truly found something here that was a disgrace to the ice cream industry, we entered, and savagely ordered a lemon sundae, being careful to disgustedly specify Sloppy ice cream. The waitress brought us a nut sundae, but we let it pass because we were interested in the ice cream not the trimmings. In our rage we grabbed a spoon and jabbed it at the ice cream—but not into it. The scoop of ice cream slid up one side of the dish and pushed part of the trimmings into our lap. But we were not convinced. This tim we went at it steadily and firmly; we shoved on th spoon until the handle began to bend; then, snap! and that ball of ice broke—also the sherbet glass that held it. We took a napkin and mopped up the rest of the trimmings off of our trousers. Stung again, we realized that the pretty young lady, who was now laughing behind the counter, gave us the right thing when she handed us a nut sundae, however, that realization didn't help our temper any s we viciously slapped four bits down and got out.

We were through investigating ice cream manufac turers names. In two hours we were riding toward a Atlantic seaport, intending to take an extended trip t Europe for our temper. Passing a small town station o the way, we noticed an ice cream tub on the depot plat form bearing the inscription "Manufactured by Pi and Eden." Pig and Eden, ye gods, what a combina tion! Yet faithful to our abandoned purpose, w jumped off the train. We located the dealer and or dered a sundae. We couldn't find a bit of garbage o tooth brush material in it. After the first one, we ha three more sundaes and finally arrived at the conclu sion that Eden was the name of the ice cream and Pi the name of the eater. Buncoed again, we went on ou way—home this time though, for our temper was cured

We had to change cars before we had gone very fa Our new train was due in two hours, so we sauntere downtown, and—Ghosts of Sherlock Holmes—look a that sign!



BUGGY ICE CREAM MFG. CO.
Wholesale Retail

We stepped right in and ordered a plain strawberry Cockroaches being the predominant bug in our hom town, we naturally expected to find them, and pro ceeded cautiously looking for same. The ice crea dwindled away, but there wer no cockroaches or else w missed them. There MUST b something to this, we thought It struck us that the most ple tiful bugs in this place migh be fleas. Fleas being smalle than cockroaches, we too vanilla this time so as not t overlook them. When we wer about half through with tha dish, we thought about th kind of bug you refer to whe you speak about a buggy top after that our search was most diligent and our progres most cautious. Done, and yet no bugs; we were de feated, chagrined, and had to come to the inevitabl conclusion that we were buggy, not the ice cream. Wit that thought in our mind, we sneaked out of the plac and rode the blind baggage home.

Fond du Lac Wisconsin

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Tempe, Ariz.—Because af constantly increasing business the Lily Ice Cream Company has opened offices in Phoenix to serve as a subsidiary to the plant and headquarters at Tempe. And for the same reason new equipment is being constantly added at the Tempe plant as daily orders are now continually taxing the capacity.

Fred J. Paddock, manager of the Lily Ice Cream Company, ascribes the popularity of the products being marketed by the establishment to the sanitary and modern methods in which they are prepared and the purity of the ingredients used.

Los Angeles, Cal.—The Globe Ice Cream Company opened their plant to the public recently.

The factory, which is said to be one of the most modern of its kind on the Western coast, will have a capacity of 200 tons of ice daily, in addition to the continued manufacture of ice cream. Nineteen miles of piping for refrigeration purposes went into the construction of the new plant, in addition to sheet cork estimated as worth in the neighborhood of $26,000. Fifty-three electric motors graduating from 300 h. p. down to 2 h. p. have also been installed.

Los Banos, Cal.—The Los Banos Soda Works, Inc., is contemplating the installation of an ice cream plant. The firm was recently re-organized and the officers elected are: J. J. Lennon, president; Joe Ramello, vice-president; Nello Iacopi, secretary-treasurer, and A. Iacopi, manager.

King City, Cal.—F. M. Williams recently opened a new ice cream plant here.

West Palm Beach, Fla.—The Gibson Baking and Ice Cream Company recently began the erection of a new concrete and tile plant for the manufacture of ice cream and Eskimo pies. The firm is capitalized at $35,000. They are equipping their plant with the most modern machinery.

Nampa, Ida.—The Jensma Creamery Company recently shipped a carload of butter to the coast. The business of this creamery has nearly doubled during the last year. The company not only does a big business in the manufacture of butter and cheese, but is the largest manufacturer and shipper of ice cream in the state.

Astoria, Ill.—The Bushnen Poultry and Egg Company have completed a new ice cream making plant, which will hold about 7,000 gallons in storage, and which will increase their output over last year nearly 300 per cent.

Kewanee, Ill.—The first ice cream of the new company organized by Frank Burke and S. A. Charles, of DeKalb and Rochelle and E. W. Smith, of this city, under the name of the Illinois Ice Cream Company, is now on the market. The product is pleasing the patrons and bids fair to win favor with the public. This firm lately bought the business of the Van Ryan Ice Cream Company.

Mascoutah, Ill.—The Eureka Beverage and Ice Cream Corporation was recently organized here with capital stock of $2,500. The firm will manufacture cereal foods, beverages, and ice cream. The incorporators are Thomas Cooper, Charles Moffit, and Albert Van Rea.

Hammond, Ind.—The Consumers' Ice Cream Company is constructing a 90 by 140 foot building, one-story and basement, for the manufacture of ice cream. The cost of construction and equipment of the plant is estimated at $60,000. James Dixson is general manager of the firm.

Syracuse, Ind.—The Syracuse Ice Cream Factory began operations for the season recently. Wm. Snavely, proprietor, is anticipating a good business this year. John Meek has been employed to help run the factory this summer. Syracuse ice cream is in great demand in the surrounding towns.

Altoona, Ia.—The Caum Ice Cream Company is building an addition to its plant.

Bedford, Ia.—Walter Evans of this city, maker of good ice cream, in keeping up with all progressive and successful businesses, has installed a ten-ton refrigeration machine.

Belmond, Ia.—Steve Antoniou is now making ice cream for the wholesale trade at the Belmond Candy Kitchen and will manufacture and ship the toothsome dainty to the various surrounding communities. The ability of the Belmond Candy Kitchen to produce high class products is well known and the new ice cream manufactory will undoubtedly do a good business.

Booneville, Ia.—After a period of almost forty years in its

541 West 25th Street — New York City

present factory, Wagner's ice cream factory is ready to transfer its activities to its new modern plant. C. F. Wagner, founder of the ice cream factory, is the oldest wholesale business man in Booneville, with one exception. Mr. Wagner has been in business in Booneville constantly since 1876—forty-six years—and has been in his present location since November, 1882, almost forty years.

Bloomfield, Ia.—The Palace Sweet Shop has purchased a complete ice cream manufacturing plant and recently began the manufacture of ice cream. They make all kinds of ice cream, sherbets and ices.

Cedar Rapids, Ia.—Miss Emma Locke, of Marion, and Mr. Lyman C. Burdick, of this city, were recently united in marriage. Mr. Burdick is manager of the Hutchinson Ice Cream factory at West Liberty.

Chariton, Ia.—The plant of the Douglas Ice Cream Company has been sold to C. D. Smith, A. V. Whitlatch, Adam Pierschbacher and E. A. Anderson, who will operate the business under the name of the Chariton Ice Cream Company. The new firm has been incorporated under the new name, the incorporators being named as the buyers and Paul D. Shreck and Ray E. Adams. Mr. Adams, who has for some months been in active charge of the affairs of the business, will continue as manager.

Leon, Ia.—The Rex Coal and Ice Co., of Creston, have installed a branch of their big ice cream factory here, which will be in charge of Willis Bray, as local manager.

C. S. Rex and Geo. P. Holmack, of Creston, completed the arrangements for the opening of the ice cream factory for business. The Rex Company have been located at Creston for years, where they own the artificial ice plant, and operate a mammoth ice cream factory in addition to their coal business. For the present the ice cream will be manufactured at the Creston plant and shipped here in quantities, where it will be repacked and distributed over the territory in every direction from this city. If the business is what is anticipated, machinery will be installed here for the manufacture of ice cream. This firm makes all kinds of plain ice cream, ice and specials.

Perry, Iowa.—The Perry Artificial Ice and Storage Company have installed new refrigeration machinery to help them take care of their increased ice and ice cream business.

Webster City, Ia.—The Webster City Cream Company re-

LYNDHURST, - N. J.

cently held a formal opening when it began operations in its ice cream plant. Mr. H. E. Forrester, former Iowa State Dairy and Food Commissioner, is in charge of the plant, which is a branch of the Waterloo Ice Cream Company. The plant is a modern one in every respect and the townspeople were delighted with it. Ice cream in cones and dishes was served free and flowers were given away as souvenirs during the opening.

Girard, Kans.—The New Roselle Creamery is now in operation under the supervision of A. H. Goadley, formerly of Sidney, O., an expert ice cream and buttermaker. The plant is larger and more modern than Mr. Roselle's former plant, which was destroyed by fire some time ago, and a 10-ton refrigeration plant, a hardening room, and a large size pasteurizer, with other machinery, have been installed.

Kansas City, Kans.—Approximately $100,000 expended recently by the DeCoursey Creamery Company, Kansas City, Kans., in enlarging its plant and adding new equipment, has made that company the largest ice cream producing concern in Kansas.

Springfield, Mass.—A one-story building, to be used as a distributing station, is being constructed by the International Ice Cream Company at a cost of approximately $22,000.

Battle Creek, Mich.—The Fields Myers Ice Cream Company, a recently organized firm, has begun the manufacture of ice cream.

Iron Mountain, Mich.—The Asselin Creamery was recently opened for business here. It is said to be one of the most modern buildings of its kind to be found in a town of this size in the Northwest. They will manufacture butter and ice cream.

Pine River, Minn.—The Pine River Creamery Company was recently incorporated with capital stock of $15,000, for the purpose of handling dairy products, including ice cream, and other farm produce. The firm is erecting a new one-story brick and tile building, 42 by 47 feet in size, which will be fully equipped to do a large business by the most modern methods. Wm. H. Keilty and Wm. and Nellie Lauritzon, all of Pine River, are the incorporators.

Madison, Minn.—After being closed for about a year, the creamery in this city has been re-opened. In addition to making butter the creamery will manufacture ice cream. S. S. Sorenson of Lamberton, Minn., will have charge of the creamery.

Marshall, Mo.—The Missouri Ice Creamery Company's plant is now in full operation and turns out some 400 gallons of ice cream and ices per day. The officers of the company are as follows: W. A. Sparks, president; O. J. Gustin, manager; J. F. Huston, secretary-treasurer.

Neosho, Mo.—H. W. Wolfskill, J. M. Carnes, and W. M. Hawk recently organized the Quality Ice Cream Company here and incorporated for $5,000.

Richmond, Mo.—Harry Lillard recently opened a modern ice cream plant here for the manufacture of "Rich Cream" ice cream.

St. Joseph, Mo.—The St. Joseph Ice Cream Company, a branch of the Greene Ice Cream Company of Nebraska City, Neb., a large wholesale organization has been established and is now open for business. The company will do a wholesale business in ice cream and expects to supply its product to towns within a radius of 100 miles of St. Joseph. The one-story building, which is 100 by 50 feet, has been remodeled and $40,000 in machinery and equipment. D. D. Miller is manager of the local plant.

West Plains, Mo.—Ben Hollingshead, formerly deputy sheriff of Howell County, has accepted a position with the Mt. Grove creamery as salesmaneger of the company's ice cream department in south central Missouri and northern Arkansas, his territory extending from Springfield south to Jonesboro.

Harlowtown, Mont.—William Van Dyke recently installed complete equipment for the manufacture of ice cream, and will be able to supply needs, not only of this vicinity but of the adjacent towns with the best to be obtained. The machinery is electrically driven, and will be in charge of Foster McMillen, who is experienced in the work. All flavors of ice cream, Eskimo pie and brick ice cream will be manufactured. Mr. Van Dyke will conduct a wholesale and retail business.

Kearney, Nebr.—The Kearney plant of the Ravenna Creamery Company recently began operations after being remodeled and new machinery installed. The plant is now a very modern and complete one for the manufacture of butter and ice cream.

Lincoln, Nebr.—The Aurora Butter and Ice Cream Company have completed the addition to their building, and new machinery has been installed. The new ice machine doubles the company's ice capacity, and many other changes increase the output of the creamery.

Lincoln, Nebr.—S. H. Hawkins and Albert Sparks, of Ellsworth, recently opened the business for the Hawkins ice cream factory in this city. The machinery for making their product is not yet installed and until it is, the trade will be supplied with cream made in the Ellsworth factory. The company has plants at both Ellsworth and Sterling and it is their intention to establish a plant here that will serve the large territory which the shipping facilities from Lincoln offer.

Syracuse, N. Y.—Work on the new building of the newly organized Cloverland Ice Cream Company is progressing very favorably. Edw. R. Hawkins is president of the firm.

Mount Airy, N. C.—J. L. Banner has rented a building here which he will remodel for an ice cream plant.

Lincolnton, N. C.—Fire of undetermined origin late tonight destroyed the Lincolnton Creamery and Ice Cream Company's plant, and a new ice-making plant attached thereto, involving a loss estimated at $60,000, partially covered by insurance.

Bradner, O.—The Bradner Dairy Company was recently incorporated here with capital stock of $10,000. The firm will handle milk, butter, and ice cream.

Marion, Ohio.—The Rockwell Ice Cream Company has been sold to Bowe Brothers of Edgar, Wis., who will continue the business for the present under the old name. The new owners are experienced ice cream men.

Marysville, O.—O. S. Dickson sold his wholesale and retail ice cream and confectionery business recently to Elba Mather and Wm. Bowersmith.

Port Clinton, O.—The Esmond Dairy Company opened for business recently. Their cold storage room was placed in commission and they began freezing ice cream. Later on they will handle milk and may establish a milk route. They will also operate a condensary. There will be a big demand

VISCO coaxes out all the goodness there is in your ice cream mix. It is making a hit east and west—north and south.

for ice cream during the summer months from the many resorts, that will about take their supply.

Sandusky, O.—The Kelly Ice Cream Company recently began the production of ice cream. E. R. Kelly is president of the firm.

Guthrie, Okla.—The Pierson Ice Cream Company's plant located at 214 North Division street, said to be one of the best ice cream factories in the southwest, suffered severe damages as a result of the terriffic tornado that struck this city recently. The greater damage was due to a flood of water that came in as the windows in the south side of the plant were torn out. Fine furniture and much of the equipment of the factory was damaged badly. Notwithstanding the great damage and the water soaked condition of the factory everything was humming at the plant the next morning.

Lawton, Okla.—The Lawton Ice Cream Company opened recently. The plant has a capacity of 2,500 gallons of ice cream a day. Mrs. C. E. Bear is sole owner and proprietor.

Brownsville, Ore.—The Brownsville Creamery recently moved into its new home, a fine new cement block building, 40 by 80 feet in size. A five-ton ice plant has been installed and, besides supplying the community with ice, the company manufactures a high grade of ice cream. They also handle the milk delivery for the town.

Hood River, Ore.—The Hood River Creamery has installed a two-ton ice machine. The refrigerated rooms of the concern were formerly cooled by ice hauled from the plant of the Apple Growers Association. The equipment will be used temporarily. The creamery is planning the early construction of a new plant, the present quarteres having been outgrown. When the new structure is complete, the machinery just purchased will be turned in on refrigerator equipment of larger capacity.

The directorate of the creamery will hold a meeting soon and reach a definitae conclusion as to the construction of the new plant. A lot has already been purchased. A concrete building is proposed.

Blairsville, Pa.—The Nelson Ice Cream Company which leased the building of the Brown Packing Company and began operations but a few weeks ago, now has a production of more than five hundred gallons of ice cream a day.

Brookville, Pa.—The formal opening of the new plant of the Brookville Ice Company occurred recently and was marked by a fine attendance. While it is not of mammoth proportions, everything is designed with an eye to sanitary and expeditious production. G. A. Carmalt, manager of the plant, was on hand to show the visitors through the place. The factory is equipped to take care of special orders of any kind, and the management is to be complimented for the quality and variety of its producers.

So heavy has become the demand for Wagner's ice cream that the present factory quarters and equipment have become inadequate to handle the trade.

The new plant is sanitary and modern in every respect. It has a capacity of 1000 gallons per day.

Johnstown, Pa.—The Purity Ice Cream Company of this city has, within the past few weeks, completed six new service stations and equipped them with large new sales cabinets of a new idea and design patented by R. W. Gearhart, manager of the local plant.

Osceola Mills, Pa.—A new firm, The Superior Ice Cream Company is to establish an ice cream plant here.

Wellsboro, Pa.—The Directors of the Schwarzenbach Brewing Company some time ago decided to equip the Galeton plant for the making of ice cream.

Camden, S. C.—The Camden Ice Cream Company recently began business here. E. L. Moseley and Wiley Sheorn are the proprietors.

Greeneville, Tenn.—Outside parties spent a day here investigating conditions and in an effort to interest local capital in an ice cream factory and additional ice plant for Greeneville. It is understood that plans were set on foot for the immediate installation of the two new industries for this city.

El Paso, Tex.—Mr. J. R. Butler opened a new $100,000 ice cream factory here about six weeks ago.

Rusk, Tex.—Work was started here recently on an ice house. It will be used for ice shipped here from Jacksonville and a portion of the building will be used as an ice cream factory by the Rusk Creamery.

Ogden, Utah.—Articles of incorporation of the Uintah Dairy Products Company of Ogden have been filed. The purpose of the company as set forth is to carry on a general dairy business and to manufacture and sell ice cream and other products. The company is capitalized for $50,000. The officers are: H. H. Hudman, president and director; C. C. Mortenson, vice-president and director; Henry Combe, secretary-treasurer and director; Albert Spencer, director, and Huber Roylance, director.

Farmville, Va.—The Farmville Creamery Company recently purchased the business of the Newman Ice Cream Company here. This firm was only recently organized with capital stock of $25,000 and with A. F. Howard, president; N. B. Davidson, vice-president, and E. S. Martin, secretary.

Anacontes, Wash.—The West Coast Dairy recently commenced delivering to their trade ice cream packed in cylindrical sealed paper containers.

Centralia, Wash.—The Polar Ice Cream Company has begun the erection of a new building which is to have 25 feet frontage and will be 100 feet in depth. It will be two stories high and of special concrete construction of most approved type such as is recommended for ice cream factories. The building exclusive of machinery will cost in the neighborhood of $9,000. When completed and machinery installed it will represent an investment by the Polar Ice Cream Co. of approximately $50,000. Work on the building is under way at the present time.

Puyallup, Wash.—A. W. Thomas, an experienced groceryman of Port Townsend, has purchased the retail department of the Puyallup Ice Cream Company, including the Purity Dairy store. He has increased the stock in the store and has added a line of confectionery and light groceries. His family in Port Towsend will join him in Puyallup later.

Huntington, W. Va.—The Wilson Creamery Company has changed its name to the Wilson Ice Cream Company.

Huntington, W. Va.—The Imperial Ice Cream Company recently held a two-day reception for ice cream dealers in the surrounding territory at their new plant.

Ashland, Wis.—The daily output of the Dhooge Creamery since it took over the plant of the Ashland Dairy Products Company, is 5,000 pounds of butter a day and 500 gallons of ice cream.

Brownsville, Wis.—The Brownsville Creamery, owned and operated by Wingo Eggleston and his father, is expanding. Recently the creamery took over the two Brownsville dairies and is now distributing milk for the town. It is also manufacturing ice and ice cream.

Notes on the National Dairy Exposition

Co-operation a Basic Need.

If the proper study of mankind is man, then the proper study of dairy farming is the dairy cow. An unproductive cow, a below-the-average or even an average cow, has not the money making elements essential to attract the business instincts of a normal American. It follows that the dairying interests of a community are no further advanced than the pedigree of the cows upon which the industry looks for its sustenance.

When the cow through her individual productivity, becomes a money maker, when the monthly cream check awakens the farmer to the possibilities of a dairy herd, then only can the distributor, the creameryman, the cheese man and the ice cream manufacturer expect to prosper. The better the cow as a producer, the better will the subsidiary interests prosper, and the distributing and manufacturing interests who are building their hopes upon the future of dairying must exercise their vision to this extent—that their prosperity is dependent upon the prosperity of the dairy cow herself.

Creamerymen, cheesemen, ice cream manufacturers, and milk dealers who attend the National Dairy Exposition at St. Paul-Minneapolis, October 7th-14th should not overlook this feature. They will find that many improvements have been made in pasteurizing and churning machinery, but they can well afford to give a thought to the co-operation with those producing interests which are striving to improve the quality and the quantity of the milk from the dairy cow.

What a Prominent Merchant Thinks of Dairying.

Dairying receives indirectly many compliments which cannot fail to create confidence in the minds, not only of the farmers, but of the merchant, the manufacturer and the banker as well. The fact that dairying influences so quickly and directly the pocket books of those engaged in it gives it a special appeal. There has come to our attention a letter of instructions sent out by Mr. Charles Gordon, leading merchant of St. Paul, in which he directs his salesmen to confine their efforts to territories where dairying is being practiced extensively and to pass up the grain producing districts. He explains that merchants in the exclusive grain producing districts are experiencing much difficulty in taking in enough cash to pay their bills while in the districts where the farmers are milking cows they have money to meet their bills promptly. This conclusion on the part of Mr. Gordon serves to emphasize the possibilities of developing the dairy industry everywhere. The Federal Reserve Bank in its latest report substantiates the conclusions of this St. Paul merchant when it makes the statement that the districts where dairying is a large factor are in very much better financial conditions than other agricultural districts.

The big outstanding thing to which the dairy industry now looks forward is the National Dairy Exposition at St. Paul-Minneapolis, October 7th-14th. Every agriculturist in this country should take an interest in this exposition and attend if possible. Everything from the dairy cow herself to the highly specialized machinery of hundreds of manufacturers will be presented in a manner that will at once educate and entertain.

North Dakota Retail Merchants Enthusiastic About National Dairy Exposition.

The annual convention of the North Dakota Retail Merchants Association has just been held at Grand Forks. Mr. Sam Crabbe, Vice President of the North Dakota Development Association gave a very interesting talk on the remarkable record made by the state of North Dakota at the 1921 Dairy Show. He called attention to the rapid growth of the dairy industry in North Dakota. He also told of the plans of the Development Association now under way for creating further interest in the industry and stimulating attendance at the National Dairy Exposition next October. He urged all of the merchants present to go back to their respective homes and work among their neighbors to further the advance of the dairy industry. Mr. Crabbe's talk was very well taken and there was much enthusiasm expressed by the attending merchants.

What applies to North Dakota, applies to other dairy states as well. Merchants, bankers, and business men everywhere are awakening to the fact that dairying is a basic, dependable cash-producing industry.

MAPLEHURST DAIRY CO. TAKES NEW MEMBER.

The Maplehurst Dairy Company, at present located in Grinnell, Iowa, was originally started in Newburg, Iowa in June, 1917. In October 1919 the company purchased the Grinnell Creamery, Ice and Cold Storage Company at Grinnell.

The original company was composed of E. M. Newcomer and E. G. Squire. On June 1st, 1922, an interest was sold to W. C. Winkleman of Chicago. Mr. Winkleman formerly operated a creamery at Whitewater, Wis.

The officers of the new corporation are: W. C. Winkleman, president; E. M. Newcomer, vice-president; E. G. Squire, secretary and treasurer.

In addition to making butter, ice cream and artificial ice, this company deals in milk in a wholesale way, taking in about 15,000 pounds a week.

VANILLA CONTROL

STANDARD VANILLA AND BLENDS

IN every highly specialized industry the laboratory plays an important part. The laboratory makes possible exact buying and manufacturing, without which the highly specialized business does not prosper.

Just consider the importance of the laboratory in the ice cream industry. Crude materials are bought on comparative tests, milk components are bought on a definite fat-and-solids basis and the finished product has a fixed overrun and fat-and-solids composition. Nothing is left to chance. And only by such methods as this is it possible to strike a favorable balance at the close of the year.

Our business, just as highly specialized, if not more so, demands the same control. Crude materials are bought, subject to laboratory approval, processes are checked, and finally, the finished product is analyzed for constancy of composition. And just as the ice cream manufacturer by such methods gives fair value to the public so do we guarantee our products to the manufacturer at all times.

STANDARD VANILLA AND BLENDS

REFRIGERATOR BODIES GROW IN FAVOR.

A good indication of the merits of refrigerator bodies in the ice cream industry is their steadily increased use by ice cream manufacturers.

John J. Grothe Company, Inc., of Woburn, Mass., an enterprising firm making refrigerator bodies of quality, is making remarkable strides in the sale of their product as manufacturers are quick to see its advantages. Here are some of their recent customers:

Canada.

Guelph, Ont.—Yeates & Thomas have added Refrigerator Bodies to their delivery equipment.

District of Columbia.

Washington—Fussell-Young Ice Cream Co. have extended their ice cream delivery by using Refrigerator Bodies.

Connecticut.

Hartford—Cebrook Ice Cream Company have added Refrigerator Bodies.

Hartford—Hartford Ice Cream Company have increased their delivery, putting on Refrigerator Bodies.

Louisiana.

Shreveport—Campbells Ice Cream factory have added Refrigerator Bodies to their equipment.

Massachusetts.

Cambridge—Mansion House Ice Cream Co. have added a Refrigerator Body which has caused favorable comment from large ice cream manufacturers. It is a "Grothe" Type B with cab built on as one unit, mounted on a 1 and one-fourth ton Reo Chassis, 125 gallon capacity and carrying 15 pounds cracked ice to each gallon.

Fall River—Peckham-Davis Co. have extended their delivery service by additional Refrigerator Bodies.

Newburyport—Olympia Ice Cream Co. who enjoy an extensive seashore trade along New England's sandy beaches have put on Refrigerator Bodies on these routes.

North Adams—Berkshire Ice Co. have put on a 300 gallon Refrigerator Motor Truck Body.

Springfield—Indessi Ice Cream Co. have increased their motor delivery by adding more Refrigerator Trucks

New York.

Valatie—Isaac Lamont & Son now have a motor refrigerator body.

Pennsylvania.

Altoona—Caum Ice Cream Co. are enlarging their refrigerator motor delivery fleet, the John J. Grothe Co. Inc., furnishing the additional equipment.

Butler—Penn-Cress Ice Cream Co. have added Refrigerator Body trucks to their delivery service.

Erie—Erie County Milk Ass'n have increased their delivery equipment with a Refrigerator Body.

Greensburg—J. M. Davison Ice Cream Co. have aded a Refrigerator Body.

Harrisburg—Hershey Creamery Co. have put on a 300 gallon Refrigerator Body.

Milton—West Branch Creamery have put to work a Grothe Refrigerator Body.

Tyrone—W. E. Hoffman have added a Refrigerator Body to their delivery equipment.

Wisconsin.

Janesville—Shurtleff Ice Cream Co. have added a Grothe Refrigerator Body to their delivery equipment.

ON ALL PARTS OF THE GLOBE.

These two fellows—(or maybe they're girls, or possibly one of each; we've been stung so many times trying to tell them apart in this country since the bob and knicker epidemic that we won't try to qualify in Africa) look as if they were in a climate where a dish of ice cream would go mighty good. They've got the means at hand for making a mighty fine grade of ice cream, for the object behind the individual with the earrings is an Emery Thompson Brine Freezer, known nationally, and in fact, internationally, for the high quality of the product turned out.

This picture was taken in South Africa where this machine is in operation, and has been widely commented upon by tourists traveling in that part of the country.

Does your business pay? If not, why keep it? Advertise it For Sale in The Ice Cream Review Want Department. Some one may be glad to buy it if they only knew it was for sale.

Is your package easy to remember?

"Putting the name across" is never an easy job. People do not make it a point to remember your name when they see it. But if the package is so designed that it will arrest their attention, if it is striking—"different"—they will begin to remember it after seeing it the second or third time. And they will associate your name with your product.

Then, too, your package must deliver its contents in good condition. And only a house that has learned, through long experience how to build the best boxes can do both jobs well.

We have designed and made boxes for exacting organizations in every branch of business. For more than 20 years we have been improving the packing methods of business houses thruout the country.

Our service department will be glad to send samples and quote prices.

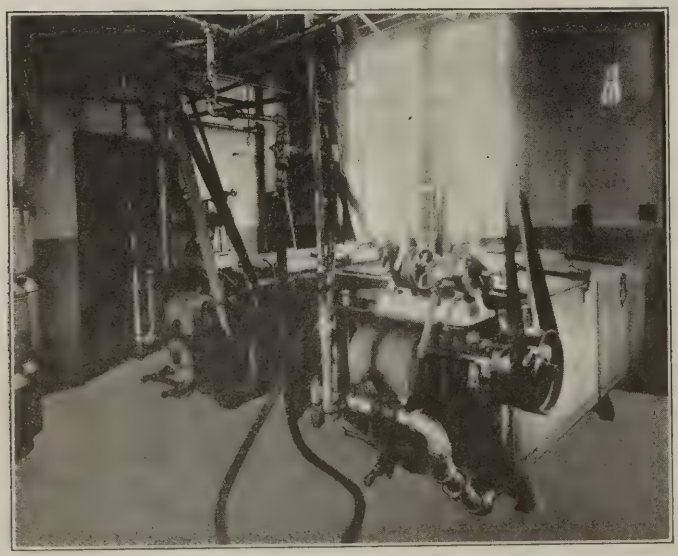
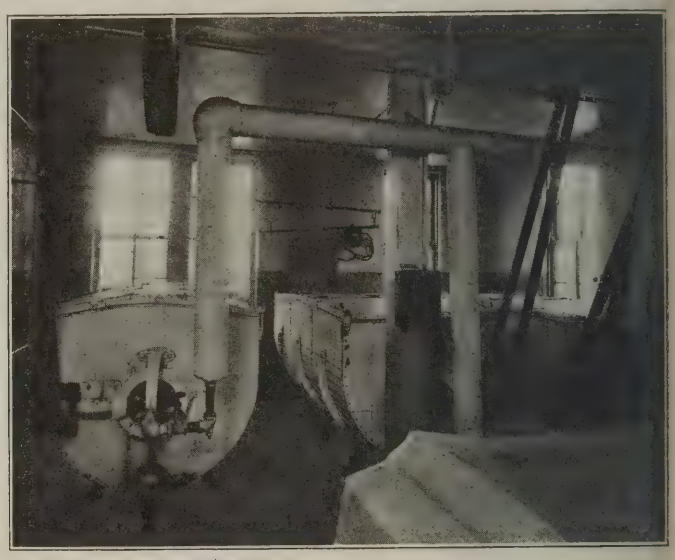
The Sessions Factory at Fond du Lac, Wis.



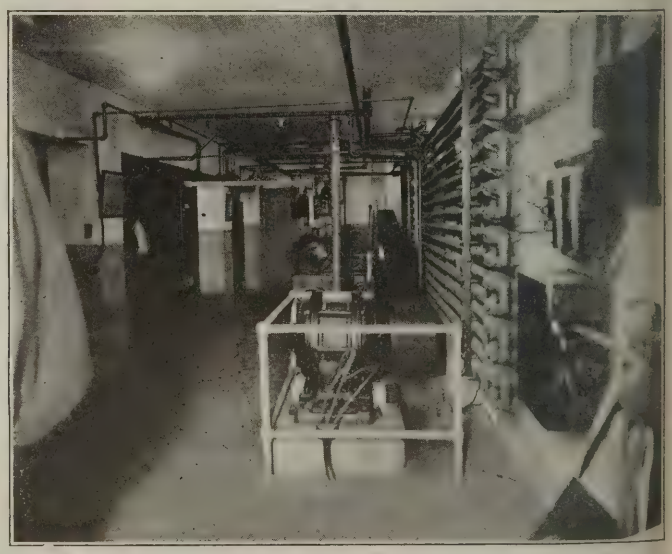
A "Review" representative visits ice cream plant of former President of Wisconsin Association

A fondness of the great out-of-doors and a desire to explore a territory we had never traveled before, led a representative of The Ice Cream Review to head his motor northward through network of concrete highways of the Badger state toward the Fountain City in the north.



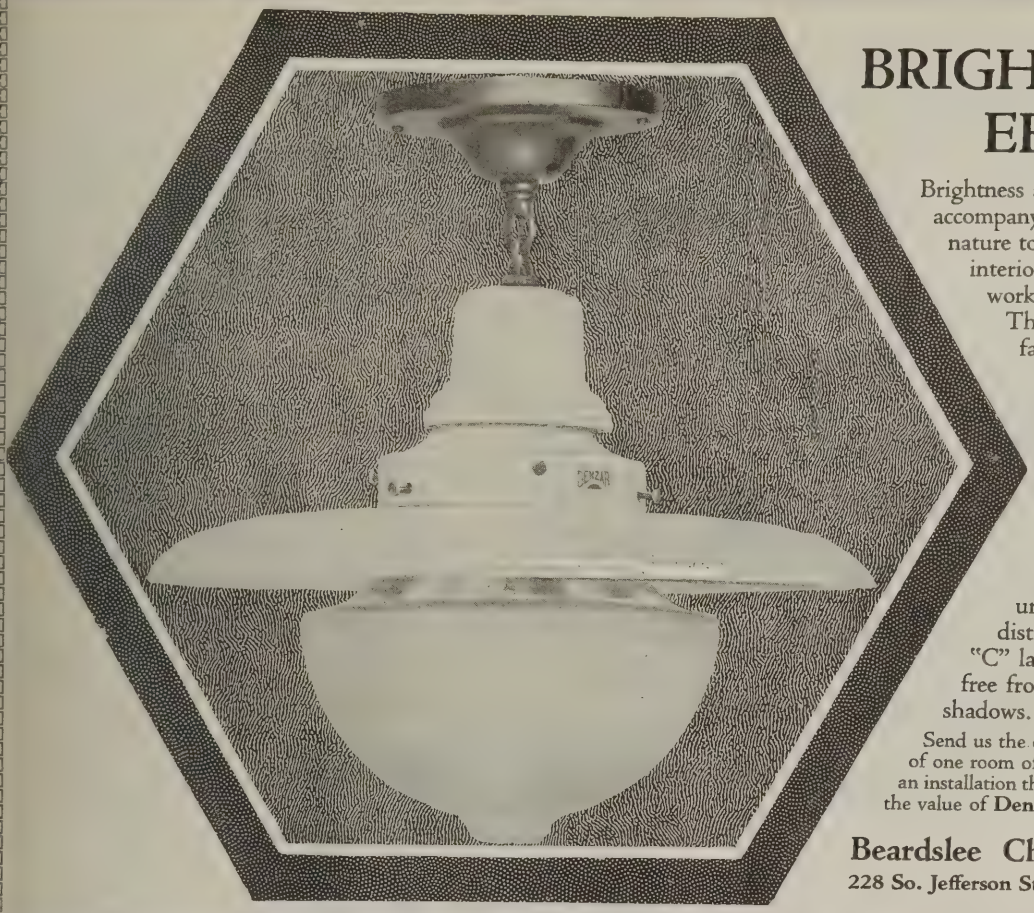
Five Forty Quart Creamery Package Freezers Are Operated Continuously.

Fond du Lac, the Fountain City, its picturesque parks, boulevards and homes, is also noted for its ice cream. In Fond du Lac, it is "Sessions" 99 44/100 per cent pure, and sold in practically every first class drug store, and confectionery in the city. No signs were needed to inform us we were in the city of Fond du Lac; here and there in the outskirts, the walk in front of a delicatessen or drug store was graced with a neat sign, black and white, "Sessions Ice Cream Sold here" and as we approached the heart of the city, and the first heralds of "ice cream-dom" remained to tease other palates, the little black and white signs came in greater numbers, growing closer and closer together till they appeared in perspective to form a hedge.



The Mixing and Pasteurizing Room.

The plant of the Sessions Ice Cream Company is well located, being near the heart of the city and a half block from the main business thoroughfare of the city. They have a fine three story plant, modern, convenient, and sanitary in every respect. Manager D. D. Smith was a very busy man making his regular calls upon dealers so the role of host was wished upon Mr. L. Bonell, the plant superintendent.



Where the Sessions Mix Is Aged.

In the office to the left of the main entrance we found order clerks and bookkeepers busily engaged in entering and charging orders coming in by phone, telegraph and mail for Sessions famous ice cream. A happy group of folks they were, busily engaged in their work even tho the "boss" was away.

Fifteen Ton Baker Ice Machine Doing the Work of an Eighteen Ton Plant.

The visit began at the receiving room where whole milk and cream are received, graded, tested and weighed before its preparation to become an ingredient of the mix. At this season of the year production is very heavy, but the demand for ice cream is so great that very little of the milk or cream received at the

BRIGHTNESS and EFFICIENCY

Brightness and efficiency just naturally accompany each other. It's human nature to be cheerful in a well lighted interior, and when cheerful, one works better and more efficiently. That is why the keenest manufacturers are using plenty of good light in their offices and work rooms.

DENZAR

The *Unit of Day Brightness* is the logical lighting unit for ice cream makers. It distributes the rays of the Mazda "C" lamp in a soft, even radiance, free from blinding glare and sharp shadows.

Send us the dimensions and height of ceiling of one room of your plant and we will suggest an installation that will convincingly demonstrate the value of **Denzar** lighting.

Sessions factory is churned. Whole milk which is not needed in standardizing the mix is separated, the cream needed in standardizing the mi xis separated, the cream used either for ice cream or butter and the skim milk sold to a local condensary. The mix is prepared in a 500 C. P. Vat, run through the Viscolizer at about 150 degrees and about 2000 pounds of pressure. After being pasteurized, and cooled over a tubular cooler, the mix is forced into aging vats shown in the picture where it is held 24 hours before freezing.

Icing and Delivery Room.

The five Creamery Package horizontal freezers are kept in continuous operation at this time of the year. Mix enters the freezer through the pipe lines at a temperature of about 36 degrees F. Brine temperature is maintained at about zero, and a batch is frozen in less than 20 minutes.

A temperature varying from zero to 10 below is maintained in the hardening room, the capacity of which

Delivery Equipment. Ice House in the Background.

is ample to take care of the needs of the plant under present demands during the warmest weather. In addition to the hardening room there are cool rooms where supplies of cream, milk and sweet butter are kept.

Refrigeration is furnished by an eighteen ton Baker ice machine, driven by a 32 horsepower motor. This, however, is not sufficient, as a large quantity of ice is put up in a building in the rear of the plant and used for the cool rooms and packing. Electrical power is used throughout the entire plant. A boiler furnishes steam and hot water for pasteurizing, cleaning and sterilizing.

Sessions Ice Cream factory was established years ago by a man named Sessions. About five years ago the old buildings were replaced by the large modern structure which now bears the name. Quality of product and service and satisfaction to customers is their slogan and if the numbers of little black and white ice cream signs may be considered criterions, it is a slogan that pays.

J. WILL CARPENTER, Pres.
Haines-Carpenter Dairy Products Company, St. Louis, Mo.
OTIS B. WITTE, Secretary
N. A. Kennedy Supply Company, Oklahoma City, Okla.

FROM THE PRESIDENT.

If the weather of June is a fore-runner for the season, I can only say that 1922 is a very profitable one for the Ice Cream Manufacturer, and that it will help offset some of the losses, if such a thing is possible, for last season.

J. WILL CARPENTER

A profitable year means successful conventions for State, Sectional and National Associations; a big meeting, that we all know, will be held this coming October in Cleveland, in connection with the mammoth Exhibit of the Association of Ice Cream Supply men, and which should be attended by every Ice Cream Manufacturer in the South and Southwest, The Southern Association at New Orleans, The Texas Association at San Antonio and last, but not least by any manner of means, the Oklahoma State Meeting, the dates of which have not yet been set, but will no doubt be arranged in order that Ice Cream Manufacturers and Supply members can arrange to attend conveniently, one to the other.

From the present indications of letters which I have been receiving from different ones in the State of Oklahoma and from Supply Men asking information regarding the Oklahoma meeting, even this early in the Season, would indicate to me that it means many more rooms, more speakers, a much better time, if possible, at Oklahoma this Fall.

I should like to suggest to the Ice Cream Manufacturers of Oklahoma and the surrounding, neighboring States, that they lay their plans now to attend the Oklahoma Meeting this Fall. Every Wolf Hound: see you there; no doubt I shall have something more definite for you later on.

J. WILL CARPENTER,
President of the Wolf Hounds

(Continued from page 122)

ICE CREAM BUSINESS ON THE BOOM.

According to a recent letter from C. R. Hauk, indications point to a record season for ice cream manufacturers. He says:

"The writer's personal opinion as to the general conditions in the ice cream industry in the state of Oklahoma, based on first hand information hot off the bat from the live wire manufacturers, is that business is on the boom, especially the package cream business. All are showing a gain over last year. The season has been a backward one, owing to so much rain and hail, but even this does not hold the output down for those manufacturers who advertise their products and hold up the quality. The day and age of the 6 per cent butterfat fellow is over. The public, through honest advertising has been educated to a point where they know the difference. This is one big reason why ice cream today is considered by the public in general as a part of their every day diet. This feeling, combined with the advertising campaigns put on by live, up-to-the-minute ice cream men, has put this wonderful product near the head of the list of foods, a position that has been gained by the combined efforts of the manufacturers who believe in and uphold quality and advertise honestly. These men do not cry "hard times." They have no reason to. Thus the story could go on and on. Big business is on hand for the go-getters. The future looks glorious. What more can man want? GO GET IT!

* * *

WHO'S WHO AT THE NEW STATE ICE CREAM COMPANY.

We just got another of those breezy letters from C. R. Hauk, and we're all pepped up. Whenever we read one of these supercharged letters we feel as if we'd like to go out and sell somebody a million dollars' worth of something, or settle this Genoa conference satisfactorily to France, Germany and William Randolph Hearst, or revise a couple of tariffs, or any similar simple pastime, all of which we feel would be an easy day's work for Mr. Hauk.

This time he gives us news of interest about a well known, progressive firm of ice cream manufacturers, who are no strangers to readers of The Ice Cream Review. In addition to all their other virtues, the last paragraph of this letter vouches for their excellent judgment, we think, don't you? Mr. Hauk's letter follows: To the Editor of The Ice Cream Review:

The following is the personnel of the New State Ice Cream Company of Oklahoma City. At the head is one of the most widely known business men in the country, one who needs no introduction to the readers of The Ice Cream Review—Mr. Carl Glitsch, President and General Manager. The new member of this group is Mr. U. G. Fowler, Superintendent. Mr. Fowler, who recently assumed his duties as Superintendent, is a well known business man in the Southwest, though new to this particular line. He has stepped right into the new work like a veteran, with the able assistance of Mr. H. C. Ashburn, foreman of the ice cream factory, whose vast knowledge of the ice cream game, gained through 15 years of study and experience has put this plant in the front ranks as being one of the most capably handled in the country.

Their cashier, Mr. Ramsey Kendrick, is a man admired by all for his pleasant manner and promptness of action. Mr. Robert Squires looks after the prompt shipment of their products during the day, and his able assistant, Mr. A. E. Spencer, does likewise at night. Thus they keep things humming 24 hours every day in the year.

Mr. Jones, the night cashier, claims he has no time to sleep on the job any night, as he also acts as telephone girl on the private switchboard after 7 P. M.

With this star line-up, and Bob at the head of the drivers, and with thirty-five employes in the factory, Mr. Glitsch has certainly surrounded himself with the livest bunch that could be collected.

"Quality and Service" is the watch word of this group. Little wonder that their business is growing by leaps and bounds, far ahead of last year's output at this time of the year. Mr. Glitsch says ADVERTISING is the helping factor. Up on your toes, boys, that's the spirit that brings home the bacon. The laggers with a grouch are left way behind in the race. Smile and the world smiles with you, grouch and weep and you do so alone.

This entire line-up, headed by Mr. Glitsch, are big boosters of the leading journal of the country, The Ice Cream Review.

C. R. HAUK,
Oklahoma City, Oklahoma.

* * *

Readers of The Ice Cream Review are familiar with the fact that the youngest Wolf Hound in captivity is Master Benjamin Ralph Hauk, of Oklahoma City, Okla. Here we have him in the foreground demonstrating an inherited fondness for the fair sex, the young lady in the case being his sister Dorcas. In the background we find him pleading with his doting sire, C. R. Hauk, for a spin in the family gas phaeton. Note the serious but proud expression spread all over Dad's map. No wonder he can sell goods to the ice cream trade. Who couldn't with such an inspiration and such responsibilities.

LIGHT EXPORT DEMAND REDUCES CONDENSED AND EVAPORATED MILK OUTLETS.

With export outlets limited by foreign competition at lower prices, condensed and evaporated milk markets have been thrown back upon domestic demand as their principal support, all classes of foreign business have been reduced to a minimum, and relief buying which for several months constituted one of the large outlets for canned milk has now become practically negligible. Rumors are to the effect that opportunities to further relief orders may be presented later, but the uncertainty which accompanied handling past orders was such that the prospect of this business contributes no strength to present conditions. Exporters look upon European countries as the most probable outlets for goods, but European factories are working back to a point of normal production, and this coupled with the fact that Australian and New Zealand factories have been able to out bid American manufacturers has resulted in the export trade of the United States falling off materially. A further condition of some influences is that in England where it has been possible to place comparatively large quantities of canned milk, prices of fresh milk have been reduced and consumers have shown their preference for the fresh product.

Export figures for May show that a total of less than 16,000,000 lbs. of condensed and evaporated combined were shipped during the month. Approximately one-third of this went to Germany and Russia, and except for about a million and a half pounds each to Cuba and the United Kingdom, the remainder consisted of smaller scattered shipments. Evaporated goods continued to constitute the bulk of the demand.

Firm Butter Markets Help Condenseries.

Firm butter markets have helped condenseries which have found it necessary to curtail production. Throughout May and so far during the storing month of June butter prices have stayed at higher levels than were generally anticipated. Cheese markets have also been steady to firm with prices likewise higher than last year. While these conditions have steadied the condensed milk situation, a more or less unsettled undertone has been evident on the part of manufacturers who have had to hold condensery production below normal.

Stocks Heavier on June 1.

Stocks of condensed and evaporated milk in manufacturers' hands June 1 were almost 20 per cent heavier than on May 1, the increase applying to all classes of goods. Approximately the same increase occurred in

LIGHT EXPORT DEMAND REDUCES CONDENSED AND EVAPORATED MILK OUTLETS.

(Continued from page 128)

unsold stocks, with unfilled orders practically negligible. While not confirmed it is reported that some of the stocks represent goods held for some time, having been made in anticipation of outlets which did not materialize. Prices have shown but little change. In the case of bulk goods the increased demand brought about by warmer weather has resulted in selling prices having advanced slightly.

ICE CREAM COMPANIES CONSOLIDATE.

The Rose Ice Cream Company of Uniontown, Pa. was recently consolidated with the I. N. Hagan Ice Cream Company of that city. The old Rose plant was entirely dismantled, and the consolidated companies will operate under the name of the Hagan Ice Cream Company. Both ice cream and ice are manufactured at their plant.

The officers of this company are: A. J. Hagan, president, R. A. Stenz, treasurer, and Jos. C. McClure, secretary. The directors are A. J. Hagan, I. N. Hagan and C. F. Hagan. The company is capitalized at $500,000.

SERVICE AND VALUE ARE TONICS OBTAINED FROM ADVERTISERS—DON'T STINT DOSES.

The Ice Cream Business for the First Half of 1922

A Report of Business Conditions from Manufacturers

THE first half of the calendar—but not the ice cream—year 1922 is gone. On June 30th we sent out a number of circulars to ice cream manufacturers asking how this year compared with last year's production. We asked:

How do your **present** sales compare with last year's (gallonage or percentage)?

How have your sales **so far this year** compared with those of the same period last year? Increase—Decrease Per cent. Gallons.

What about future prospects?

Do you find the supply of fresh raw material greater or less than last year (milk and cream instead of butter, powdered milk, etc.)?

Do you find collections easier than last year?

Of course we knew what the total answer would be; it couldn't be anything else than an increase, but what is more interesting is just how much the increase has been.

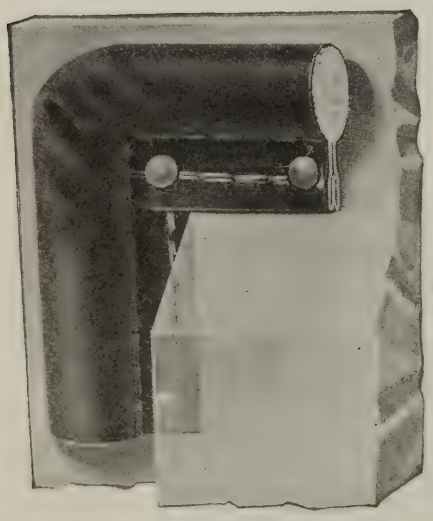
For convenience, we have divided the states into groups. The first group includes the New England States, New York, New Jersey and Pennsylvania. Practically every manufacturer in this territory, except those in the bituminous coal fields of Pennsylvania, reported an increase. There were no unusual increases, but a steady general increase, indicating the fact that the consumption of ice cream is growing. Future prospects were reported good; supplies of fresh raw materials the same or greater, and collections easier. One manufacturer in the bituminous coal fields reported a decrease of almost 40 per cent in business, but the coal strike is responsible for that and it cannot be used as a business indicator. Future prospects in this section are dependent upon the settling of the strike, and collections are slow.

Group two includes Delaware, Maryland, Virginia, West Virginia, the Carolinas, Georgia and Florida. This territory seems to have the strongest general increase of any in the United States. It seems that the year didn't start off very well on account of inclement weather. A few manufacturers report a decrease in production for the first half of the year, but all reported an increase in present sales over last year's, with the single exception of one who said it was about the same. The largest decrease for the year reported was 10 per cent. Increases for the half year ranged from four to 50 per cent, and for the months of May and June, they ran as high as 90 per cent.

"Good," "Very good," "Excellent," and "Business getting better all the time," are some of the expressions used to indicate the optimism of the Southern ice cream manufacturer.

Replies to the next question certainly brought out the fact that the Southern farmers are going into dairying on a larger scale than formerly. The supplies of fresh milk and cream for raw material were reported greater in every case.

Money is evidently easier in this territory, too. One manufacturer reported collections harder than last year, a few of them reported about the same, but the general run of answers was "Yes," "Much easier," etc.



The reports from group three were not so good. This territory includes the states of Ohio, Indiana, Illinois, Michigan and Wisconsin. Subtracting the answers reporting "about the same," the remainder was equally divided between the "decreases" and the "increases." Weather, new factories, cut-throat competition, and the Illinois coal strike got the blame for the decrease. It is worthy of note, however, that the increases were larger than the decreases.

The fact we like to observe is that most of the "decreases" say that future prospects are good, with a few modifying phrases in some cases such as "dependent upon the weather," and all of the "increases" report future prospects good or fine.

The supply of fresh raw material is reported greater, or the same, with a few exceptions who report less. A little more than half of the manufacturers have found collections easier; of the remainder, three-fifths reported the same, and two-fifths reported slower.

The West North Central territory, consisting of Minnesota, Iowa, Missouri, the Dakotas, Nebraska, and Kansas, reported in about the same manner that the previous group did, except that there were fewer manufacturers reporting decreases. The weather and the cotton crop "copped off" the blame for decreases and gloomy future prospects in this group.

The South Central group, consisting of Tennessee, Kentucky, Alabama, Mississippi, Louisiana, Texas, Oklahoma, and Arkansas, carried the high men, but did not stand up as well in general as did the South Atlantic group. One manufacturer reported an increase of 120

per cent for June; another reported an increase of 100 per cent for the half year, and several of them ranged around 50 per cent. Slightly more than one-third of the answers received reported a decrease. The weather again came in for a good share of blame for decreases, while possibilities of strikes and no cotton crop got the blame for pessimistic future prospects.

The outstanding fact in this group is that collections are harder. Only one manufacturer reported collections easier; several reported the same; several more simply answered "No," but wrote it as if they meant it pretty thoroughly, and the remainder used such expressions as worst, harder, or not as good.

Finally, we have the Western group—all states west of those already named, and the coast states. Reports from this section were of the steady general kind, indicating a sure and not too slow progress, with the exception of California, which has made much greater gains, but which may be directly attributed to the remarkably rapid increase in the population of that state.

There are several things worthy of comment in these reports. One manufacturer didn't give us any percentage of increase, but just put down "May, 1921—4,081 gal.; May, 1922—10,483 gal.; June, 1921—5,047 gal.; June, 1922—9,611 gal." Another manufacturer wrote:

"Replying to yours of the 30th, relative to our present sales, compared with last year's, beg to advise that our gallonage will amount to better than double of what it did last year. Future prospects seem very bright for further increase in gallonage. We are building up our business on quality products, however, profits are not near so good this year as last, due to cut-throat competition in our section. We have unscrupulous competitors who will make any kind of a price on any kind of a deal to get a customer or hold a customer. However, we are rapidly gaining; especially is this true since we have only been in the ice cream business the past couple of seasons."

We happen to know that ice cream is not the only dairy product that this firm has made a fine success with, and that success, in either case, was directly due to quality product and quality advertising.

Quite in contrast to this man's method is the manufacturer who gives as a reason for his decrease in business, "Money scarce and sales are limited, but general business conditions are much better." Money may be scarce, but if general business conditions are better than last year, money is more plentiful than it was then, and this ice cream manufacturer is not getting his share of it. Either this man has not found the real cause for his decrease in sales, or he needs to advertise his product.

Advertising is surely the one great need of the ice cream business. Many manufacturers still consider it a seasonal product and a luxury; manufacturers who had bad seasons so far, blamed their decrease on cold or cool

B-K Bacili-Kl Trade-Mark

Universal Purifier For the Dairy Industry

B-K has been accepted by the Dairy Industry as the Standard Sterilizing Agent. From farm to factory it is used to prevent bacteria from causing inferior dairy products. Farmers, manufacturers, inspectors, physicians, health boards, and dairy schools agree that B-K fills an important need in the problem of maintaining greater purity of dairy products.

Such universal acknowledgment of the value of B-K can only be the result of exceptional merit backed by intelligent cooperation from our Laboratories.

It is our business and our pleasure to help you to better products and more profits.

Ask for Bulletin No. 320, telling How B-K is used to improve quality.

All Supply Houses carry B-K.

weather, and those in the strike districts said that money was so scarce that people couldn't afford to buy ice cream because **they considered it a luxury.** People drink their coffee and tea just as hot in the middle of August as they do in January, and it is only fair to assume that they can eat their ice cream just as cold in January as they can in the middle of August, once they get the idea. It is a well known fact among ice cream manufacturers, and some of the public, that ice cream is not a luxury; substantial evidence of this was that during 1921, when other businesses were at their lowest, ice cream plants were doing a regular business and new plants were springing up all over. People must eat no matter how bad business conditions are, and if ice cream is considered a food instead of a luxury, people will buy it no matter how bad conditions are. One manufacturer says that his business has increased 30 per cent because "people are learning to eat more dairy products." That is a good reason for an increase and another is: "People buy ice cream because there is no other dessert so healthful and refreshing and yet so reasonable in price." There are the two sides of the situation; why not have only one?

A number of manufacturers complained about new plants selling their ice cream too cheap and giving all kinds of concessions to get and hold business. Such statements as, "New factories are offering concessions that are impossible and cannot make a profit; it is bound to cripple the industry and break themselves," and "Abuses of the trade are being tolerated which are not to the best interest in general," were quite frequent. These are regrettable facts, and it is certainly to be hoped that manufacturers who are engaging in such practices will soon reconsider and run their businesses on right principles.

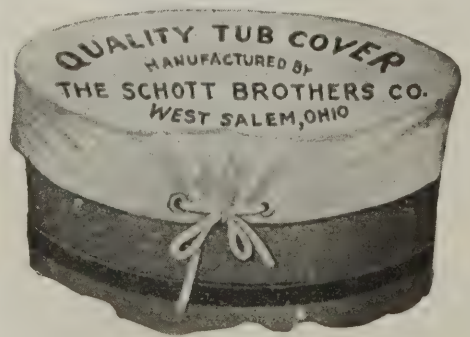
To sum it all up, we believe that the ice cream business so far this year has made a very substantial gain over the corresponding period of 1921. The large increases and decreases in business were, no doubt, mostly in smaller plants which have not thoroughly developed or stabilized their market. Taking into consideration the average of increases and decreases, there is only one conclusion—the ice cream business is growing and not with the growth of the population but in direct proportion with the increase of value and quality advertising.

BOUQUETS FOR THE LIVING.

Editor The Ice Cream Review:

Your June issue is certainly a pippin. If there was any question about the character of the industry in general, this issue should certainly put the quietus and finishing touches on same, and convince the most skeptical that any industry capable of sustaining a trade paper of this character must be taken out of the lists of infantile industries and placed in the catagory with many of our leading industrials, hardly any of which can claim to have a monthly journal of 150 pages devoted to their exclusive interests, and doing the work as thoroughly as The Ice Cream Review.

The writer was particularly impressed with your news item in relation to the development of this industry in foreign climes, and feels that this is a feature on which you cannot lay too much stress for the reason that our company's records will show that the demands for ice cream machinery from across seas has increased at least 500 per cent in the past twelve months, proving to our satisfaction that the arrival of two million Yankee boys on foreign soil a short time ago, not only helped to put out the most serious conflagration the world ever saw, but also installed and left behind them on their return, a wholesome appreciation of the merits of ice cream—not as a delicacy, but as an actual article of diet and of real food value; and it is our thought that this is the time right now when we, through our organizations and trade papers, should put our shoulders to the wheel and back up (with all our accustomed energy and Yankee ingenuity) the work which our boys so unconsciously started, and which we know will prove an immense benefaction to those countries as it did to this, and incidentally ought to be a benefit to many of our organization members if not financially, at least morally.



Furthermore, to prove that these benefits are not local, but are spreading all over the old world, we recently sent you, an electro of a rather primitive ice cream plant lately established in South Africa, which you are at liberty to publish, if you find it of interest and care to adopt our suggestion.

We also wish to compliment you especially on your questionaire; that to our mind is very constructive work. On reading your replies to same, wish to state that the writer (who has been mixed up in this line for many years) received some very valuable ideas, many of which were entirely new to him, and our thought is that no doubt many of your readers, supplymen as well as ice cream manufacturers, will probably find just as much enlightenment perhaps on some of their problems.

Assuring you of our most earnest hope of being of assistance to you in your original efforts on behalf of our industry, and with personal best regards, we remain,

Yours very truly,

MORE DATA ON FREEZER SIZES.

The following letter reached us too late to be printed with other letters on the same subject in the June number:

Relative to your letter regarding the use of the large type freezers instead of the small machines, we state that we have have delayed answering this until we could have further opportunity to make some tests on the results obtained from the large machines.

As you know we last year put on the market a 160 quart machine that has been highly successful in every way. We have recently made some tests on the very question raised in regard to the effect on the overrun, during the drawing of the cream into the cans.

During the drawing of one batch into three gallon cans, we took three tests and found a variation of only one degree in the overrun. In other words, the last end of the batch was one degree lower than the beginning.

We made another test during the drawing of a batch from a 160 quart machine into brick slabs and during the drawing the overrun dropped three points.

We do not think that this record can be beat by any 40 quart machine. Our experience being that with the same amount of cream drawn from a 40 quart freezer the variation would be considerable more than one point.

The freezers are so constructed that the discharge is very rapid and the stream does not fluctuate. For this reason they can be emptied very quickly. During the recent tests above mentioned the 160 quart machine was emptied into the three gallon cans in one minute.

In one plant in which these large machines are operated they draw the cream into hoppers and the cans are filled from the hoppers on the floor below. It takes about forty-five seconds to empty this large machine into the hoppers.

There is no question but that the satisfaction that is given by these large freezers in the matter of overrun is to a great extent due to the fact that they can be so quickly emptied when the proper overrun has been reached, and in this rapid discharge we believe we have overcome the objection that has properly been raised to the large machine.

We have made these tests on the largest machine that we make so as to get the results in this extreme size, and while we have not made any tests on the smaller machines, we have no doubt but that the results would be equally as good in our 120, 80 and 60 quart sizes.

We do not urge the manufacturers in all cases to put in large machines. There is no doubt but that any wholesale factory should have at least two machines and if their output is not very large they, of course, should use their judgment as to the size that these two machines should be.

We have many plants who have put in 2-40 quart machines and some that have put in 2-60 quart machines. On the other hand we have some plants that have put in 1-120 quart and 1-40 quart machine. The large machine being used for vanilla, strawberry and chocolate, and the 40 quart machine for special's. We, also, have plants that have put in 3-120 quart machines and some with 3-160 quart machines, and we find the tendency everywhere seems to be toward taking out the 40 quart machine and putting in the larger type instead of increasing the number of small machines, and we have never yet heard any of these manufacturers express any regret at the change, as they are able to turn out a much larger quantity of cream with fewer men and much less space in the freezing room.

U. S. FREEZER & MACHINE CORP.

TEXAS FIRM QUADRUPLES CAPITAL STOCK.

The Milk Products Company, with ice cream plants at Port Arthur, Orange and Beaumont, Texas, has increased its capital stock from $10,000 to $40,000 to take care of the expansion of their business. The plant at Beaumont, which was only recently completed, is built and equipped in the most modern manner and has hardening room capacity of 2000 gallons.

This firm manufactures ice cream exclusively in their three plants and is enjoying an exceptionally fine business, which is expanding exceptionally fast. The officers and directors are: D. Button, president; Chas. R. Stevenson, vice-president; R. C. Allis, secretary, and W. C. Ross, treasurer and general manager.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

RESUMPTION OF BUYING BY EUROPE ANTICIPATED.

Lull in Demand Only Temporary Is Tenor of Reports—Accumulated Supplies Not Sufficient.

Europe will again be a buyer in the American market in a comparatively short time in all probability, judging by advices that have been received from European importers of refined sugars.

The lull in the export demand, it appears, is not wholly due to competition from Java or to high prices, though these undoubtedly have had an effect.

Exchange Situation a Factor.

Another factor which has brought about the dullness of the past two weeks is the exchange situation, the depreciation of the value of European currency, more particularly that of Germany, having acted as a deterrent to purchases.

On the other hand, Europe has shown a natural resistance to the advancing prices of the American and Cuban markets, and buying was lessened, to some extent on this account.

Information from reliable European sources, however, is to the effect that the greatest factor in cutting down the demand for American granulated has been the fact that earlier heavier purchases have supplied immediate needs and that the sugars already bought which are now being consumed have enabled European firms to await developments before placing further orders.

European buyers, however, are not under the impression that they are through buying in the American market, and are said to admit without hesitation that they will be obliged to call on the refining capacity of this country to cover their further wants in the fall.

While this is the attitude of British buyers, French and Norweigian buyers are keeping up their activity, or at any rate are showing interest in export sugars.

Germany out of Market.

The demand from Germany seems to have dropped out of sight as a result of the unusually adverse exchange situation. Germany, however, it is intimated, will need further supplies before the German beet crop is available.

From well informed sources in close touch with the situation in Java it is learned that Germany has drawn on that source for supplies to a considerable extent, and it is believed that her imports this year from all sources have been far above the amount generally supposed and will be possibly as high as 400,000 tons.

NEW ICE CREAM PLANT FOR DURHAM, N. C.

In a letter received recently from the Durham Ice Cream Company, they say they have purchased a lot in the heart of the business district, containing 13,000 square feet of ground, upon which they contemplate building a two-story ice cream plant, with a capacity of 2000 gallons daily. They will install a twenty ton ice plant. This move is made necessary by the rapid growth of their ice cream business.

In addition they will install a first class bakery and catering business. All equipment and machinery will be of the most modern type.

NEW BRICK MAKER IN USE IN CHICAGO.

There is a growing demand among users of brick ice cream for bricks that are perfectly formed and uniform in size. In order to supply a local demand for a machine which would cut bricks uniformly and rapidly, Reichel and Drews, of Chicago, brought out a machine which operates either by hand or power, which cuts the slab into eight bricks at one operation. The machine has seven knives which are rigidly fixed at the proper distance apart, so that the bricks are all exactly alike in size. The use of seven knives also permits an extremely rapid operation, since the entire slab is cut at once.

Before offering the machine for sale, the cutter was tried out thoroughly in the large plant of the Chapell Ice Cream Company in Chicago. After a thorough test under working conditions, it was offered to other Chicago manufacturers, with the result that it has found its way into nine Chicago plants. This great popularity is a substantial endorsement of the merits of this brick cutting machine, more information regarding this machine may be secured by writing to Reichel & Drews, Chicago.

TIME REQUIRED TO FREEZE, WHY IT VARIES.

Under his title an article appeared in the June issue of The Ice Cream Review on page 140, but two good letters from the western part of the country came in just a little late so we are publishing them this month.

DUE TO RE-PASTEURIZATION.

I have, in the past, had the trouble you speak of, slow or varied time for freezing and hard to get the desired overrun. Eighty-five to ninety per cent overrun and three batches an hour was all I could get. It is needless to state here all of the many earnest efforts on the part of many, directly and indirectly concerned. I wish to state here, with all modesty, that I detected the trouble from the beginning, but, at that time, being only second-man in the department, I did not like to crowd my opinion too hard although I did express it at that time. I think I can honestly state that over $2,200 was spent trying to find a remedy to no avail. The whole trouble was simply this; we were buying "pasteurized" cream and "re-pasteurizing" it too high before homogenizing. I finally got permission to try my theory and bought raw cream and pasteurized it properly and froze a batch every eleven minutes with 100 per cent overrun.

* * *

Depends Upon Handling.

The question tho somewhat closely circumscriber, seems to imply difference that solids, age and acidity do not cover. The following may possibly have some bearing: first, nature and source of solids; second, the conditions of aging, and third treatment of material during mixing.

Literally the question would limit us to different freezings of the same mix as the implication is that the different freezings are identical. From my own experience I do not believe this is what is wanted; rather, why the difference in different mixes supposed to be the same. In the same mix the method of freezing, the kind of freezer, amount of overrun desired, might be suggested tho have no such trouble myself.

In different mixes where very likely the most trouble has been had, I can say that mixes made of raw sweet milk and cream usually whip easier than the heavily pasteurized and homogenized ones. Old milk and cream, even at the same acidity, will whip better after mixing as a general rule. Again mixes made largely of milk powder will take longer to freeze and harder to get required overrun unless given special treatment. Numerous such combinations could be given. Different mixes of the same age and makeup will vary considerably, depending on ripening temperature used, especially when widely different numbers of bacteria are pres-

ent or different species predominate. A light acid or non acid producing bacteria could produce a considerable change not noticeable to taste. Someone qualified may disagree with me emphatically, but my observation without means of positive proof indicates such to be a fact.

It is evident that the same material may be made into widely varying product by different methods of mixing. Differences that materially effect the whipping may pass the operator unnoticed. For instance, we were carrying the sugar content very close to the line of poor whipping and testing in mixing vat before homogenizing. A slight mishap delayed the mix, hot in pasteurizer, for an hour. About 15 gallons of water were evaporated making the sugar content too high so a very poor overrun was obtained. Numerous such instances could be cited showing what to many is the same solids, acidity, age, etc., is really considerably different. I feel that in conditioning mix there is much to be learned and what here is suggested only the merest observations made while operating.

⚜

MADISON FIRM TO BUILD $150,000 PLANT.

An $80,000 milk and ice cream plant will be erected by the Kennedy Dairy Company, at 629 West Washington Avenue, on the site of its present ice cream factory, formerly owned by the Zilisch Milk Company. With the machinery to be installed in the new building, the plant will represent an investment of approximately $150,000 when completed.

The dimensions of the structure are to be 87 by 133 feet. The plant will be built of stone, brick and reinforced concrete. The building will be two stories high. The latest and most sanitary machinery will be installed, according to Emerson Ela, a member of the company. The company also plans on installing its own ice plant.

"When the building is completed, we will give Madison a first-class milk producing plant," said Mr. Ela.

Mr. Edward J. Samp, one of the incorporators, will be manager of the plant. Other incorporators are Attorney William Ryan and Attorney Arnold Peterson.

The building of the Zilisch Milk Company, which stands on the property purchased by the Kennedy Company, will be razed to make way for the new plant. It is expected to be ready for occupation by September.

⚜

NEW WEBSTER CITY CREAMERY IN OPERATION.

The fine new factory of the Webster City Creamery, Webster City, Iowa, which has been in process of building for about two and a half months, is now in operation. This is the first plant in this city which is a combined creamery and ice cream factory.

H. E. Forrester, formerly with the Iowa State Dairy and Food Commission in Des Moines, and a dairyman of nearly twenty-five years' experience, is manager of the plant. He, with the assistance of his three sons, did most of the work of getting the building in shape for occupation. The three boys and one daughter will be associated with their father in the operation of the plant.

It is estimated that the cost of the building, equipment and installation will total $18,000.

Cream is delivered to the plant at a side door, where a small bell is located which enables the farmers to summon attendants to assist with unloading the cream. The attendant weighs the cream and tests it for butterfat content, after which it is pasteurized. The cans are returned to the owner after being cleaned and sterilized with live steam.

If the cream is to be churned, it is pumped from the pasteurizer to the churn by an automatic pump. The pipes through which the cream is conveyed are sectional, and can be taken apart and cleaned. The buttermaking is in charge of Mr. Forrester, who possesses a great number of medals for his fine butter.

Cream for use in ice cream is piped in another direction, into a mixer, which is operated by a one-horse power motor. From the mixer it is run through sectional pipes into the freezer. The freezer is of 40 quart capacity, and is operated by a three horse power motor. From the freezer the frozen cream is placed in a hardening room of 2,400 gallons capacity. At the rear of the building is a room where the ice crusher is operated, and where the cans are packed for delivery. There is also equipment here for cleaning incoming cans with live steam. In the basement is a fifteen horse-power boiler which supplies steam for cleaning the cans. Here also is located the twelve ton refrigerating plant.

Cement has been used on the floor of the main room of the creamery and the basement will also have a cement floor as soon as improvements are completed.

Provision has been made to install other freezers in the plant as soon as the business warrants their installation. The present plant, running full speed, would have a daily capacity of some 1,500 quarts of ice cream a day.

The company which operates the local plant has ice cream factories at Oelwein, Waterloo and Cedar Falls.

⚜

NEW "CREAM OF CREAMS" PLANT AT KENOSHA

The Blommer Ice Cream Company of Milwaukee, Wis., manufacturers of "The Cream of Creams," with plants at Milwaukee and Wisconsin Rapids, have lately completed their third plant, which is at Kenosha, Wis.

The new Kenosha plant is the last word in ice cream plant construction and equipment, according to Wisconsin Dairy and Food Inspector, Madison, and ice cream supplymen who have seen it. The building is one-story with full basement and built of reinforced concrete. It is equipped with two 120-quart direct expansion freezers and has a capacity of 2,500 gallons per ten-hour day. The point of special interest is the hardening room, which is equipped with an eight inch cork inlay. "The hardening room of our Milwaukee plant is equipped with six-inch cork inlay and we are of the opinion that it could stand more without overdoing it, so we added an extra two inches in the Kenosha plant," says Mr. Geo. Blommer.

The Blommer plants are all equipped with the most sanitary equipment obtainable. All vats and pasteurizers are Elyria glass lined, the freezers are of large capacity, and all pipe lines are of sanitary sectional construction that can be readily taken apart and cleaned without even the use of a wrench. Modern efficient machinery properly arrainged is the source of heavy production in the Blommer plants. One illustration of efficiency is seen in the arrangement of the brick-making department of the Milwaukee plant. The brick slabs come from one end of the hardening room, are dipped, forced out of the container with air pressure, cut, packed, packaged—several bricks of assorted flavors going into a package—and go down a chute back into the hardening room all in one continuous operation which does not permit a lost motion.

The mix for the Blommer plants, sufficient to make about 6,000 gallons of ice cream daily, figuring on an overrun of 85 to 90%, is all made in Milwaukee. The cream going into the mix comes in daily from reputable large dairies, and, although the butterfat content is held reasonably close to the 12 per cent standard, the total milk solids content is permitted to run over the standard about three per cent. "This," says Mr. Blommer, "is

the chief reason for the increasing popularity of 'The Cream of Creams.' By the looks of things at present we will have to add another story to the new Kenosha plant for next year."

Three brothers, George, John and Al. Blommer are behind Blommer's ice cream. Two of them, George and John, look after their Milwaukee interests and take a run down to Kenosha occasionally, and Al. has charge of the Wisconsin Rapids plant. Mr. Wm. Isermann, general salesmanager of the company, has charge of the new Kenosha plant, and Ernest Bauman is superintendent.

WINDBER, PA., TO GET ICE CREAM PLANT.

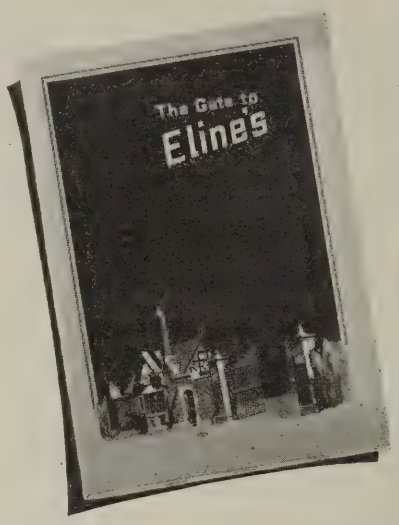
What will be one of the most up-to-date ice cream plants in this section of the state is now in the course of erection at Windber, Pa. Frank Tarr, the genial proprietor of the Grand Central Hotel, is having the building erected and upon completion will himself engage in the manufacture of ice cream on a large scale. The building, which adjoins that of the hotel property, will cost in the neighborhood of $30,000 and will have a capacity of 400 gallons per day. It is 100 feet long with a frontage of 40 feet. It will be two-stories high and constructed of brick, stone and concrete, and will be obsolutely fireproof. The upper story will be an apartment house, in which Mr. Tarr and his family will reside. The first story will be devoted exclusively to the manufacture of ice cream, which is to be sold wholesale only. There is to be a refrigerating plant of the latest approved type, with all the modern machinery that goes toward the making of an up-to-date concern of this kind. The plant will be in charge of an experienced maker of ice cream. It will soon be in operation.

E. D. FRANCKE AND SONS OF SAGINAW MAKE IMPROVEMENTS IN PLANT.

E. D. Francke and Sons, makers of Francke's Quality Brand ice cream at Saginaw, Michigan, have practically doubled their capacity by the addition of another 15-ton York ice machine and another hardening room. They have also installed a conveyor and have taken out several partitions, which gives them more room.

This firm is a partnership of father and three sons, namely, Emil D. Francke, Arthur N. Chester A. and Leonard N. Francke.

THE ICE CREAM FIELD.



A new publication in ice cream trade circulars is the "Ice Cream Field" published at Atlanta, Georgia, by D. A. Loyless and edited by Craddock Goins. Vol. 1. No. 1 appeared last month. Good trade publications dignify and help develop any business and we cordially welcome this splendid addition to the ice cream trade press family.

ILLINOIS ICE CREAM MANUFACTURER DEAD.

A card has just reached this office announcing the death on May twenty-sixth of Mr. William F. Prast, a partner of the Cherry-Prast Ice Cream Company, of Danville, Illinois. The Ice Cream Review extends its sincerest sympathy to the family and friends of Mr. Prast in their bereavement.

SOME UNIQUE VIEWS AND NEWS ABOUT CHOCOLATE AND COCOA.

From the mass of literature that comes to The Ice Cream Review week in and week out there must be something of unusual interest about a certain booklet, folder or other piece of printed matter to cause a lull in the routine of our operations and just naturally impel an anxiety in us for an immediate thorough inspection and reading.

Such was the case when we opened an envelope and feasted our eyes on a highly attractive booklet entitled, "The Gate to Eline's." The "gate" itself is something that will be appreciated by the man who enjoys good architecture and history, but for the busy ice cream man who is progressive and ever seeking information and knowledge about the ingredients of his product, there is something back of "The Gate to Eline's" that is best told in the pages of this splendidly illustrated booklet.

Chocolate and cocoa are two products that in the past year have played a greater part with the ice cream manufacturer than ever before in the history of the industry. When combined with ice cream chocolate and cocoa is surely a tasteful combination. It forms the opportunity for a variety of ways in which the ice cream manufacturer can increase sales.

So every ice cream manufacturer who wants to learn something more about chocolate and cocoa will find in "The Gate to Eline's" the best collection of educational photographs and instructive paragraphs relative to these products, their origin and preparation, we have ever seen.

The expense of getting up this booklet no doubt makes its promiscuous distribution prohibitive. It is worth writing, however, to Eline's, Incorporated, Milwaukee, Wisconsin, where, if copies are available we are quite sure interested ice cream manufacturers will receive courteous consideration in the order requests are received.

A NOVEL PICTURE CONTEST.

Fortune's, Incorporated, of Memphis, Tennessee, have undertaken a means of popularizing their All-Cream Ice Cream and Cococones that is somewhat unusual in its nature, and certain to be very effective. The are offering a prize of $50 for the best child's photo or Kodak picture to be used in advertising these products. There are no rules or restrictions to this contest, the only requirement being that in every picture the Cococones and ice cream must be plainly visible. It is announced that a committee of disinterested judges will select the winning picture.

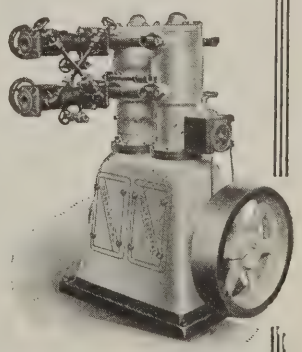
For stimulating interest locally and acquainting the public with their product, this method is excellent, for not only does it create great interest among the children, but among parents as well. Such a campaign as this, backed up by the products that are all that they are "cracked up" to be, is sure to be a success.

CONTINENTAL

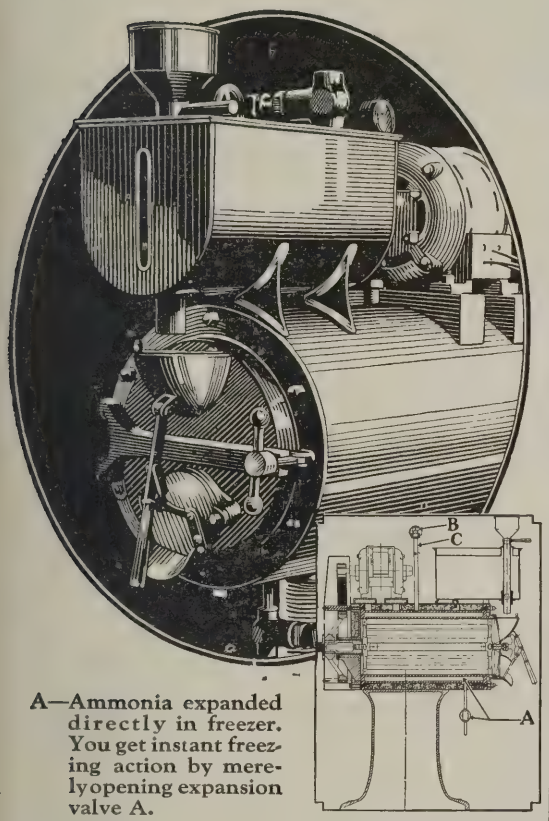
Modernizes

Ice Cream Freezing

GREATLY reduces operating cost and speeds production. Simply turn a valve and you get instant freezing action, no time wasted, no brine to pump.



With this Continental money saving freezer you get a greater swell, more uniform consistency—better quality product—better satisfied trade.



See this marvelous machine in operation—and you will readily understand why it is the most distinct improvement ever achieved in ice cream freezers.

Investigate it—NOW. Write for Bulletin 28-C.

We also build compressors and complete refrigeration equipment for ice cream plants.

With a Continental Compressor you make ammonia do its best by intense control, high speed, ribbon valve and avoidance of lubricating oil contamination in refrigerating coils—and remember—no ammonia can enter a Continental Crank Case.

Cross Section of Continental Direct Expansion Freezer

A—Ammonia expanded directly in freezer. You get instant freezing action by merely opening expansion valve A.

B—Absolute temperature control; opening or closing suction valve B regulates temperature instantly at any point desired by operator.

C—Combination temperature and pressure gauge; constantly indicates temperature maintained in freezer cylinder, thus enabling operator to know exact temperature and to raise or lower it at will.

The other advantages are equally important and desirable.

Co-operative Service

Our Service Bureau and Refrigerating Engineers will gladly study your particular problem and offer recommendations for your consideration without any obligation whatever. This department is maintained to co-operate with our customers and as an authoritative source of practical, helpful information for those interested in efficient refrigerating equipment. Put your problems up to us; if you like we'll send you a data sheet for this purpose.

THEY EAT ICE CREAM ON SUNDAY IN HUNTINGTON, W. VA.

Even in these Volsteadian days of Sahara-like aridness, there are such occurrences as "ripping off the lid," and having a jamboree that is absolutely devoid of inebriation, other than such mental exhilaration as accompanies the release from restraint that has been placed upon individuals by misapplied authority.

Residents of Huntington, W. Va., have for a matter of three years been held down, so far as Sabbath day deportment is concerned, by the vagaries of a mayor, who enforced every law on the statute book since the day Noah drove the first nail into his now famous houseboat.

When Mayor C. W. Campbell went into office in June, 1919, he started out immediately to redeem his preelection pledges about law enforcement pertaining to Sunday closing, and he invoked everything that was ever written into the city or state books.

But the worm has turned, to employ the vernacular, and Mayor Campbell, after a regime of three years, has been dethroned, his successor being the man he defeated for office, Floyd S. Chapman.

Without any particular ceremony Mayor Chapman proceeded to cut the Gordian knot that has held his constituency enmeshed and the people responded by having a veritable orgy sans liquor, for the first time in three years on a Sunday several weeks ago.

They regaled themselves with ice cream in cones, bulk, brick and every other conceivable form until the town's supply was exhausted.

Restraint was cast to the four winds, the movies beckoned to the unleashed populace, ball games were in full swing and the soft drink parlors did a land office business.

The people gave vent to their pent up feelings by going the limit, but in a dignified and orderly manner. They had had their fill of Sunday denials, and old folks joined with the kiddies in having a rollicking good time.

An observer, who chanced to be in Huntington on this memorable occasion declares it was a sight for sore eyes, to see the enthusiasm with which the people entered into the spirit of the occasion, and to say that Mayor Chapman was the hero of the occasion is putting the facts mildly. If it had been within the gift of the voters of Huntington to make him president of the United States and chief porter of the Fiji Islands, he would have won in a walk.

When Mayor Chapman lowered the bars of restraint he did not confine himself solely to appeasing the Sabbath-day gastronomical desires of the populace, for his edict also had something to do with conditions at the municipal bathing beach, which on Sunday for three years had been deader than the tomb of the Pharoahs. Here young women were permitted to splash about in one-piece suits with extremities that were determined entirely by their own sense of decency and modesty. They do say the young ladies mirrored their predilections in this matter by furnishing the assembled "multitudes" with one of the most exquisite optical feasts conceivable.

In fact the day proved a huge success and scored another victory for the champion of a down-trodden people.

A clever bit of advertising which is utilized in the West by a leading ice cream firm, reads as follows:

"When your sweet tooth calls for ice cream, let your wisdom tooth say (name of manufacturer).

ICE CREAM REMOVED FROM PALE OF BLUE LAW ENFORCEMENT.

A great big splash of white, judicially applied, has taken a great deal of the indigo out of the atmosphere which has enveloped Bucyrus, Ohio.

This town has been waddling about its daily duties in habiliments of blue for some time, but it devolved upon Common Pleas Judge William F. Duncan to brighten matters up a bit for the home folks when he ruled without reservations that in the future it will be no violation to sell ice cream on Sunday, which has been under the ban.

This progressive magistrate was hearing several cases of alleged violations of the blue laws, including the sale of ice cream, when he made the pronouncement that ice cream is indisputably in the food class, possessing practically all the elements of nutrition, and is recognized as such by the authorities on such subjects.

In announcing his decision, which placed the sale of ice cream without the pale of the stringent blue laws, Judge Duncan said the very nature of ice cream makes it impossible to preserve it for any length of time, after it has been purchased, thereby precluding its purchase on Saturday night for consumption on Sunday.

This constructive interpretation of the food laws by Judge Duncan takes on special significance when it is known that the Barrister is one of the strongest advocates of the campaign being waged in the Ohio town for a stricter observance of the blue laws.

The Sunday closing law enforcement in Bucyrus is being espoused by the leading citizens and apparently will win the day but Judge Duncan seceded from the ranks of the leaders in the movement just long enough to put across a most commendable decision.

According to all of the facts available Judge Duncan has not in the least impaired his standing in the community, but on the contrary has in all probability recruited to his side a not inconsequential army of little folks who clamor for ice cream and who will some day exercise the right of franchise, and if Judge Duncan is looking for support from this direction to retain his judicial position will be able to count a substantial number of ballots bearing an X after his name.

This is only another illustration of common sense accurately applied when the best interests of the people are concerned.

AMMONIA LEAK INTERRUPTS WORK AT ICE CREAM FACTORY.

Ammonia gas escaping through a valve in which the packing was blown out, caused the factory of the Berlin Ice Cream and Dairy Products Company, Berlin, Wisconsin, to shut down temporarily one morning recently. The suffocating fumes drove the entire working force out of the factory for a time, and stopped the taking in of milk.

Not a gas mask in condition to be used could be located in the city, it was said. A few venturesome spirits attempted to enter the workroom, but the stifling atmosphere drove them back. Finally a window was broken on the east side of the building, and the valve turned so that the escaping gas was shut off. In a few hours the air had cleared so that work could be resumed.

This may suggest to other manufacturers that it is a good idea to have a gas mask or two around the factory in case of a similar emergency.

Did you ever get up a party, invite your friends and then worry whether they would send regrets or flowers? Did you ever get fooled and have them all run in on you and the supply of ice cream and cake run low before you had served half of them?

If so, then you know how we felt when "the bunch" swooped down upon us in our new home, took possession, put their feet upon the mahogany furniture and proceeded to tell us how glad they were to see us. They came in singles, doubles, triples and home-runs and if we looked good to them they surely looked good to us. They brought bouquets of every description and littered up our desks with expressions of good will and kind wishes. They left nothing undone to make the occasion memorable for us.

These dignitaries were in attendance upon the convention of the Associated Advertising Clubs of the World, and they left their jamboree to come and see us and help us celebrate the opening of our new publishing plant.

We tried to make them feel at home, but we probably made a sorry mess of it. We were as bashful as a debutante at her first coming out party, and the things we said and did to these many kind visitors were not the things we would say and do under normal conditions. We hope that they gained the impression that they were welcome and will be welcome at any time. And you folks who couldn't be here at our opening, come and see us when in Milwaukee. We have something we want you to see. If you don't find the latch string hanging out kick in a window. We want you to come.

SALES BOOSTER FOR ICE CREAM BARS.

In the April issue of The Ice Cream Review an article appeared entitled "The Manufacturer's Point of View," which summarized the replies to over a hundred questionnaires regarding the manufacture and sale of chocolate coated ice cream bars. Some of you may remember that the replies to one of the questions brought out the fact that the main difficulty encountered by the retailer in selling these bars was keeping them in a properly frozen condition.

A new invention placed on the market by the Northwestern Corporation of Morris, Illinois, appears to furnish an attractive means of eliminating this difficulty. It is a unique cabinet arrangement, one of the most convenient contrivances conceivable for keeping these bars in a 100% salable condition, and at the same time bringing them to the favorable attention of the public.

The bars are kept constantly packed in ice, the only operation necessary to emit them from the cabinet being a simple turn of a handle. Very little warm air is admitted by this process, which reduces the ice shrinkage to a minimum, and insures a constant low temperature.

An advertisement of this cabinet, which gives an interesting account of its usefulness and convenience, appears on page 71 of this issue of The Review. Turn to it now, and establish an acquaintance with this new invention.

GRAND RAPIDS TABLE COMPANY PLANT DESTROYED BY FIRE.

On July 4th the factory of the Grand Rapids Table Company, Grand Rapids, Michigan, was completely destroyed by fire.

This firm, in addition to manufacturing tables, made the well known NoSwet ice cream cabinet.

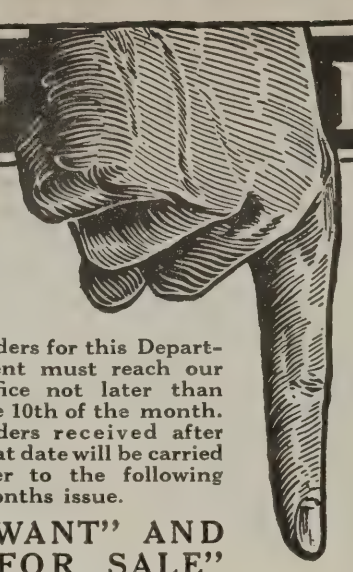
⚜

BROADVIEW FIRM PLANS TO REBUILD.

Rebuilding of the stable building and warehouse of the Broadview Dairy Company, which were damaged by fire to the extent of $18,000 to $20,000 on June 7th, will begin as soon as details can be cared for and plans made according to Manager Frank B. Flood.

Mr. Flood also stated that the damage was fully covered by insurance.

⚜



His Interpretation.

A profane man was reminded of the Scriptural command: "Swear not at all." "I do not swear at all," was his response. "I only swear at those who annoy me."—Boston Transcript.

WANT DEPARTMENT

Orders for this Department must reach our Office not later than the 10th of the month. Orders received after that date will be carried over to the following months issue.

"WANT" AND "FOR SALE"

Notices will be published at the rate of 2 cents per word, cash with order. For blind address 15 cents extra.

NOTE: Names and addresses of advertisers using blind addresses cannot be furnished direct from this office. The advertiser can be reached only by using the key number and addressing your reply care of "The Ice Cream Review."

NOTICE.

The Ice Cream Review disclaims any responsibility for the reliability of parties advertising in the Want and For Sale Department, nor for the truthfulness of statements made in such advertisements. In answering such ads, ask for references if parties are unknown personally, before sending money. Our subscribers are requested to assist us in keeping unreliable parties from advertising by reporting any suspicious dealings.

HELP WANTED

THE TREMENDOUS SUCCESS of the recently invented confection, "ESKIMO PIE," has demonstrated the wonderful possibilities of protective patents and trade-marks for novel confections. Patents procured, trade-marks registered; 22 years' experience. Instructions and terms on request. Robb, Robb & Hill. 920 McLachlen Bldg., Washington, D. C., and 1385 Hanna Bldg., Cleveland, Ohio. 2-22tf

EMPLOYERS!—Men, men, men—the crying need of the day! If you need any men in your business today, read the following ads and see if you can use any of these. The fact that these men are advertising here stamps them as unusually progressive. Write them and give them a chance to sell their services to you. "Ice Cream Review," Milwaukee, Wis. tf

WANTED — Soda Fountain Department Manager—by large Pacific Coast jobber. Must be experienced, live, energetic executive, capable of managing salesmen, ordering and expanding established fountain and supply business. Give full particulars of experience in first letter. F. Norton, 42 First St., San Francisco. 7-22

WANTED—An experienced bookkeeper for a co-operative milk plant producing market milk, butter and ice cream. Address: Delta Milk Producers Association, Escanaba, Mich. 7-22

POSITION WANTED

POSITION WANTED — By ice cream maker, eighteen years experience, desires position with reliable concern. Willing to go any distance. Address: R-284, Ice Cream Review. 7-22

POSITION WANTED—Expert ice cream maker thoroughly conversant with all details of manufacture A to Z would consider position as superintendent in small city where could locate family and home permanently. Now superintendent of large Chicago plant. Address: R-298, The Ice Cream Review. 7-22

POSITION WANTED—By an ice cream maker who thoroughly knows his business and not afraid to work. No proposition too big. Address: R-297, Ice Cream Review. 7-22

POSITION WANTED — By ice cream maker with 20 years experience in all branches of business. Position in West preferred. Thoroughly familiar with all details and capable of handling entire plant. Understand pasteurization, standardizing, homogenizing, refrigeration, mixing, freezing. Can handle help to advantage. Familiar with all modern machinery and methods. First class references. J. W. Scott, 1905 23rd St., Detroit, Mich. 7-22

POSITION WANTED—By reliable well experienced married man to take permanent charge of medium sized plant for butter making, ice cream, milk, cream and buttermilk. Can help you over rough places. Address: R-296, The Ice Cream Review. 7-22

POSITION WANTED — Dairy chemist and bacteriologist desires employment with progressive dairy concern. Experienced in technical control and manufacture of various dairy products. Know how to work and anxious to get ahead. References furnished. Address: R-292, Ice Cream Review. 7-22

J. G. Cherry Company,
Cedar Rapids, Iowa.

Gentlemen:

It gives us considerable pleasure to express the satisfaction we have attained in installing various pieces of Cherry Equipment.

We might say that since we put in the Five New Dreadnaught Model 50 Freezers, which was less than a year ago, we have saved approximately $400.00 on labor and we should judge about $2500.00 on repairs on the equipment as a whole.

This equipment has indeed been serving very satisfactorily and we feel that it can be very highly recommended.

Yours very truly,
JERSEY FARM DAIRY CO.,

Syracuse Ice Cream Company

Wholesale and Retail Manufacturers of

PLAIN AND FANCY CREAMS AND ICES

Office and Refrigerator Plant:
Cor. PLUM and TRACY STS.

SYRACUSE, NEW YORK

July 5th, 1922.

The Association of Ice Cream Supply Men,
1328 Broadway,
New York,
N. Y.

Gentlemen:

The ice cream shows put on by the Association of Ice Cream Supply Men have been of inestimable value to the ice cream industry at large.

I have attended each and every one of your shows for a number of years past, and I fully believe that ice cream manufacturers who want to keep up with the latest achievements of the manufacturers of ice cream factory supplies, can not afford to miss your shows.

It would take many miles of travel and weeks of time to visit the plants who exhibit at these shows, and I know that the large majority of manufacturers throughout the country feel very grateful to your Association for having made it possible to see the valuable lines on exhibit at centered points throughout the country.

I am

Yours very truly,

SYRACUSE ICE CREAM COMPANY

AUGUST 1922

BULLETIN OF EVENTS

National Dairy Exposition, Minnesota State Fair Grounds, Minneapolis--St. Paul, Minn., October 7-14, 1922. W. E. Skinner, Secretary, Ryan Hotel, St. Paul, Minn.

National Exhibition, Association of Ice Cream Suppy Men, Cleveland, Ohio, October 16-21, 1922, headquarters Hotel Winton. Robert Everett, 1328 Broadway, New York, Secretary.

National Association of Ice Cream Manufacturers. 22nd annual convention, Cleveland, Ohio, Hollenden Hotel, October 16th, 17th and 18th. N. Loewenstein, 155 N. Clark Street, Chicago, Secretary.

Pacific Ice Cream Manufacturers' Association—Annual Convention, Davenport Hotel, Spokane, Washington, November 13, 14, 15, 1922. Bert H. Walker, Royal Ice Cream Co., Tacoma, Wash., Secretary.

Southern Association of Ice Cream Manufacturers, annual convention, New Orleans, December 5, 6 and 7. J. W. Clopton, Secretary, Decatur, Ala.

MR. BERT H. WALKER, Secretary of the Pacific Ice Cream Manufacturers Association, Tacoma, Washington, pays his respects to irresponsible newspaper writers in a communication in this issue. After calling attention to the sensational tirade against the ice cream industry by A. W. McCann of New York, he expresses the opinion that it is about time that reputable manufacturers are protected from attacks by such writers. We fully agree with Mr. Walker, and we hope the time will come when men cannot commit such hideous crimes under the popular but overworked theory of freedom of the press.

Mr. Walker suggests that the editor of the New York daily newspaper in which McCann's articles appear is in sympathy with the sentiments expressed by McCann. Not necessarily, Mr. Walker. He may be and probably is in sympathy with them only so far as the affect advertising in his publication. In last month issue we called attention to the fact that a few yea ago this same McCann conducted a similar campaig against creamery butter manufacturers who refused advertise in the paper he represented. The reputab creamerymen refused to pay tribute in this manner, ju as reputable ice cream manufacturers will refuse to pa tribute in McCann's present efforts to force them spend money for advertising. The editor lets the c out of the bag when he says "There is a fortune f some man who will make pure ice cream and adve tise it."

This tirade of McCann's should fool nobody, b unfortunately it does. It fools the uninformed consum who is ready and almost anxious to believe everythin of a sensational character that he hears about estal lished institutions or industries. Such a bare-face blackmailing campaign should not be possible in a ci ilized community. As stated above, we hope the tim will soon come when our much touted freedom of th press will not permit irresponsible scalawags who pose a experts to tear down what honest business men hav built up without getting the punishment which the crim deserves.

THE big event for Southern ice cream manufacture will be held in New Orleans on Dec. 5th, 6th an 7th. The annual convention of the Southern Associatio of Ice Cream Manufacturers will be held in that city o those dates, and we have a letter from Mr. J. W. Clopto Secretary, in which he says that "judging from th interest shown in the coming convention it will be th biggest one ever held in the South." We have no dou about it. We know how the business men of New Orlea treat their visitors and it is true Southern hospitalit that they show them. The editor has attended conve tions of different kinds in New Orleans and recalls wit pleasure the entertainment that was provided by Ne Orleans business men to their visitors. A trip to a bi sugar plantation and refinery a few miles from the cit is a most interesting one, and we hope that delegat to the coming convention will be accorded the pleasur of inspecting this big institution. We have made a rangements to secure some interesting information abou this plantation and refinery which we are going to giv readers of The Ice Cream Review in a subsequent issu

OUR readers will be particularly interested in th information contained in this issue relative to ic cream standards in the various states. The pure foo law of each state establishes certain requirements whic the ice cream manufacturer should be familiar with, no only to avoid trouble, but to profit from the experienc of the men who fathered such requirements. The infor mation we have compiled was gained from authoritie recently, so it may be accepted as authentic and righ up to date.

DURING the hurry and hustle of the busy time of the year it is hard to realize that cooler weather will soon be here and that with it will come the big gatherings which always interest the ice cream men. First of all comes the big National Dairy Exposition in the big livestock amphitheatre at the Minnesota State Fair Grounds, midway between St. Paul and Minneapolis. This is the big dairy event of the year and is the place where all branches of the dairy business are represented and where all may find things of intense interest. This big show runs from October 7th to the 14th, inclusive. The ice cream manufacturer can find much to interest him. Following the National Dairy Exposition comes the National Exhibition, Association of Ice Cream Supply Men in Cleveland, Ohio, on October 16th to the 21st. On October 16th, 17th and 18th the National Association of Ice Cream Manufacturers will hold its annual convention. Everything of interest to the ice cream manufacturer will be at Cleveland.

We cannot urge too strongly upon readers of The Ice Cream Review to avail themselves of the opportunity to attend these big doings. You cannot attend such functions without learning things that will help you make more money in your business.

MANY accidents in factories might be avoided if proper precaution were taken to prevent them. It is clearly the duty of the management of any manufacturing business to provide adequate protection to employees against accidents. The more machinery in operation the greater the responsibility as a rule. In those days when the ice cream factory was largely made up of hand operated appliances it was comparative easy to avoid accidents.

With improved machinery and lots of it the chances for a serious accident have been multiplied many times. This has been offset to a considerable degree by the enforcement of safety measures by state officials, but law enforcement can only correct some of the greatest elements of danger. There is a lot for the management to think about in addition to meeting the requirements of law. It is more than a humane question, it is a good investment to take every precaution to avoid accidents. "A stitch in time saves nine," and an employee on the job is worth more than one in the hospital.

NOT long ago it was our privilege to visit an ice ice cream manufacturer who makes good ice cream, and who is building up a fine business. A situation prevails in his town, however, which it is hard for us to understand. Six different brands of ice cream are sold in his town and only one retailer is buying his ice cream. His business is about three years old, and previous to the time he began operations the town was without an ice cream factory for many years. These outside brands of ice cream are all good brands and are popular. We sampled the local man's product and we are sure he makes just as good ice cream as the best sold in his town. He enjoys a good business in the surrounding towns but his local business amounts to very little. He wants to know how to get the local dealers to handle his ice cream. We would like to tell him, and we are passing the question on to our readers. How would you go about it to get this local business?

SOME ice cream manufacturers make the mistake of neglecting to advertise to the home trade. They seem to work on the theory of the storekeeper who refuses to advertise because everybody knows him and knows where he does business. This is the result of a dangerous state of mind.

The home folks may know you as an ice cream manufacturer and they may know that you make good ice cream but they must be told about it regularly and effectively if you are to enjoy the results of the highest possible ice cream consumption in your community. People act on suggestions and if you keep suggesting to them to buy ice cream they are going to do it often. If they don't get the suggestion they will not buy it so often. The business man who depends upon his customers to act upon their own suggestion never enjoys the business he might enjoy if he makes the suggestions to them. Don't neglect the home field. There lies the best opportunity you have to increase gallonage.

THE man who furnishes a market to the dairy farmer for his milk or cream, whether he manufactures it into butter, cheese or ice cream, is performing a real service to his country. We doubt whether there was ever a time before when dairying was so greatly appreciated by the farmer as at the present time. The farmer who has had milk or cream to sell during the past year has not suffered like the farmer who is not interested in dairying. He has enjoyed a regular cash income and has not had to deny his family the necessities of life. He may not have enjoyed his accustomed purchasing power and he may even think that he is poverty stricken, but he doesn't know what poverty is like. It is a well known truth that nothing else holds a farmer on a milk stool like hard times. Then is when he best appreciates his cows and his market for his milk and cream.

WE HEARTILY agree with a correspondent who says that the term "filler" should be dropped from our ice cream vocabulary. He says that the only possible "filler" for ice cream is water, and that the term "filler," as applied to any ingredient of the mix, is a misnomer. Our correspondent, whose letter appears on another page of this issue, suggests the word "stabilizer."

State Ice Cream Standards

A Compilation of Requirements Regarding Milk Fat, Gelatine, Etc., of the Various States up to August 1, 1922.

WE HAVE taken upon ourselves the task of compiling the laws of all the states relating to the ingredients of ice cream. In the summary which follows, a few states have been omitted because the necessary information was not obtainable at this time.

It is to be understood that "gelatine" includes vegetable gum as well, as both are usually specified, but "gelatine" is used for our purpose here. A star in or at the end of a paragraph indicates a reference to a paragraph below, quoted direct from the laws of the state. Discussions of matters of a general nature immediately follow the direct quotations; these points are the ones a manufacturer is most liable to misunderstand or misinterpret and should be read thoroughly.

Federal Standard—Fourteen per cent milk fat required, fruit and nut ice creams 12 per cent.

Alabama—Adopted federal standards.

Arkansas—No state laws regarding ingredients of ice cream but many cities have ordinances.

California—Milk fat ten per cent, fruit and nut ice cream, eight per cent; .6 per cent gelatine allowed.

Colorado—Ten per cent milk fat, no exceptions; gelatine allowed and no limit specified.*

Connecticut—Eight per cent milk fat, fruit and nut, six per cent; gelatine allowed and no limit specified.*

Delaware—Adopted federal standards.

Florida—Fourteen per cent milk fat, fruit and nut, 12 per cent.*

Georgia—Eight per cent milk fat, no exceptions.*

Idaho—Fourteen per cent milk fat, fruit and nut, 12 per cent.

Illinois—Eight per cent milk fat, no exceptions; use of all other ingredients ordinarily used permitted.*

Indiana—Eight per cent milk fat, no exceptions; must contain 18 per cent total milk solids, including milk fat, and not to exceed .7 per cent gelatine.

Iowa—Twelve per cent milk fat, fruit and nut, 10 per cent; gelatine not to exceed one per cent, and acidity must not exceed .3 of one per cent.

Kansas—Ten per cent milk fat, no exceptions; 20 per cent total milk solids, including milk fat, and finished product must not weigh less than four and three-quarters pounds per gallon. All cream and milk products must be pasturized.

Kentucky—Ten per cent milk fat, fruit and nut, eight per cent.

Louisiana—Ten per cent milk fat, fruit and nut, eight per cent; not more than one per cent gelatine.

Maine—Fourteen per cent milk fat, fruit and nut, 12 per cent.*

Maryland—Eight per cent milk fat, fruit and nut, six per cent; one per cent gelatine.*

Michigan—Ten per cent milk fat, fruit and nut, eight per cent; .7 per cent gelatine permitted.

Mississippi—Eight per cent milk fat, no exceptions; .5 per cent gelatine permitted.*

Missouri—Eight per cent milk fat, no exceptions; gelatine permitted, no limit specified; certified colors permitted.

Montana—Ten per cent milk fat, fruit and nut, nine per cent; must have total solid content of 33 per cent; one per cent gelatine allowed, and a gallon of finished product must not weigh less than four pounds.

Nevada—Adopted federal standards.

Nebraska—Fourteen per cent milk fat, fruit and nut, 12 per cent.

New Hampshire—Fourteen per cent, no exceptions; .2 per cent gelatine allowed.

New Jersey—Eight per cent milk fat, fruit, nut and egg may have six per cent; certified artificial colors and flavors permitted.

New Mexico—No state standards but cities have own regulations.

New York—Eight per cent milk fat, specials* six and one-half per cent; 18 per cent milk solids and fat combined, 15 per cent for specials.*

North Carolina—Eight per cent, no exceptions; gelatine not to exceed four ounces to ten gallons.*

North Dakota—Twelve per cent milk fat, 10 per cent fruit and nut; for gelatine and colors see reference.*

Ohio—Eight per cent milk fat, no exceptions; .5 per cent of gelatine allowed; must not weigh less than four and one-quarter pounds per gallon.

Oklahoma—Ten per cent milk fat, eight per cent for fruit and nut; must have total solids content of 32½ per cent.

Oregon—Eight per cent milk fat, six per cent in fruit and nut ice cream; gelatine not to exceed one per cent allowed; acidity shall not exceed .3 per cent.

Pennsylvania—Eight per cent milk fat, nut and fruit, six per cent; .5 per cent of gelatine allowed.

Rhode Island—Eight per cent milk fat.

South Carolina—Adopted federal standards.

Tennessee—Eight per cent milk fat, some exceptions; 18 per cent total milk solids, including milk fat, some exceptions; gelatine permitted, no limit specified.*

Texas—Eight per cent milk fat, fruit and nut, six per cent; .2 per cent gelatine allowed.

Utah—No standards.

Vermont—Fourteen per cent milk fat, fruit and nut, 12 per cent; gelatine permitted, no limit specified.

Virginia—Eight per cent milk fat, no exceptions; four ounces per ten gallons allowance of gelatine, and coloring as permitted under the national law.

Washington—Eight per cent milk fat and 18 per cent total milk solids, no exceptions; gelatine permitted, no limit specified.*

West Virginia—Eight per cent milk fat, no exceptions; .7 per cent gelatine permitted; artificial colors may be used if so labeled.

Wisconsin—Twelve and ten per cent—see reference;* .5 per cent of gelatine in all cases, and melted product shall not be less than one-half of product as sold.*

Wyoming—Ten per cent milk fat, no exceptions; gelatine permitted, no limit specified—see Colorado reference.*

* * *

Colorado—The use of eggs, gelatine and vegetable gums is not forbidden, but must not be used to conceal an inferior product.

* * *

Connecticut—Ice cream shall be deemed adulterated within the meaning of this act if in substance and quality it fails to meet the provisions and standards required for standard ice cream, or if it shall contain boric acid, slicylic acid, formaldehyde, saccharin or any substance deleterious to health, or if it shall contain salts of copper, iron oxide, ochres, or any coloring substance or compound or flavoring matter deleterious to health, provided nothing in this section shall be construed to prohibit the use of harmless colors permitted to be used in foods, or of harmless imitation flavors, if the presence of the same shall be made known to the purchaser thereof.

Sec. 4. Nothing in this act shall be construed to prohibit, in the manufacture of ice cream, the use of fresh eggs, pure gelatine or harmless vegetable gums; and nothing in this act shall be construed to prohibit the manufacture and sale of ice cream containing less than the amount of milk fat required by section two of this act, provided the true fat content of such ice cream be plainly and conspicuously stated on the container in which it is sold, or in the case of ice cream sold in bulk, that the true fat content be made known to purchasers thereof by means of a suitable sign displayed at the time and place of sale. (See comment below.)

* * *

Florida—Any frozen milk product that does not comply with standards of Ice Cream provided in section two shall have plainly printed on each package, either wholesale or retail, the common names of the ingredients contained therein and shall not be sold under the name of Ice Cream.

"This is the Can We Want"

Wrote a large ice cream manufacturer across our advertisement in "The Ice Cream Review" with an arrow pointing to this can. This is one of many similar letters received from all sections of the United States.

Electric Weld rivetless-solderless ice cream cans are used in all parts of the country.

No Solder

This is the can you will want, too, for the low cost and economical can service

PATENTED

No Rivets

This is the can backed by the strongest GUARANTEE

Electric Weld cans have made many loyal friends for us. One customer's repeat orders total

50,000 Electric Weld Cans

JOHN WOOD MFG. CO. Conshohocken, Pa.

(OFFICES AND WAREHOUSES)

CHICAGO OFFICE (320 E. North Water St.) CLEVELAND OFFICE (2041 Warren Rd., Lakewood, O.) BOSTON (60 Pemberton Sq.)
BROOKLYN Bush Terminal Bld. No. 5) OAKLAND, CAL. (335 Cypress St.)

Georgia—Para. 16—The sale of homogenized frozen milk products in Georgia as "Ice Cream" is in violation of the law.

The sale of such product is hereby prohibited, except when full notice is given the purchaser of the nature of the product, and the same is branded or labeled "Homogenized Frozen Milk Products."

* * *

Illinois—Provided that nothing in this section shall be construed to prevent the sale of any wholesome food product which is below such standard if such article of food be labeled so as to clearly indicate such variation.

* * *

Maine—The Maine regulation as to the standards for ice cream is not a law, but a regulation made by the commissioner of agriculture, the authority for which is given him under statute.

* * *

Maryland—* * * to which may be added fresh eggs and **not exceeding 1 per cent of pure gelatin,** gum-tragacanth or vegetable gum, **without statement of such fact,** and such goods may be called ice cream, provided the required percentage of fat is maintained. But such product when not containing 8 per cent and upward of milk fat shall be labeled, showing the percentage of milk fat; if imitation flavoring materials are used, the label must state the fact.

* * *

Mississippi—Any frozen product other than ice cream shall be designated and sold as sherbet or water ice.

* * *

New York—* * * which does not contain at least eight per centum of milk fat and at least eighteen per centum of milk fat and milk solids not fat combined, except that when the ingredients of ice cream shall include eggs, fruit, fruit juices, cape confections, cocoa, chocolate or nuts, such reduction in the percentages of milk fat and milk solids not fat as may be due to the addition of such ingredients shall be permitted or approved, provided the product shall contain at least six and one-half per centum of milk fat and at least fifteen per centum of milk fat and milk solids combined.

* * *

North Carolina—4. Compound ice cream is a frozen product made from cream, sugar, and other wholesome food products, and contains not less than four per cent of milk fat.

5. Imitation ice cream is a frozen product made from cream, sugar, and other wholesome food products, and contains less than four per cent of milk fat.

6. The sale of a product as ice cream which contains less than eight per cent and as much as four per cent of milk fat, will not be contested, provided the same is labeled compound ice cream; or if a placard bearing the statement:

"COMPOUND ICE CREAM SERVED HERE."

shall be posted in a conspicuous place in the room where any and all persons may see same when purchasing ice cream; and provided further, that the statement on placard is printed in plain black letters not less than one inch in size, on a white background.

7. The sale of a product as ice cream or compound ice cream which contains less than four per cent of milk fat will not be contested, provided the same is labeled imitation ice cream; or if a placard bearing the statement:

"IMITATION ICE CREAM SERVED HERE"

shall be posted, as is provided for in the sale of compound ice cream.

* * *

North Dakota—Gelatine ice cream is a frozen product made from cream and sugar, with or without natural flavoring; and contains not less than twelve per cent (12%) of milk fat, and not more than four ounces of pure gelatine for each ten gallons.

Gum ice cream is a frozen product made from cream and sugar, with or without a natural flavoring; containing not less than twelve per cent (12%) of milk fat, to which has been added a small quantity of gum powder free from starch or other cereals, and free from any harmful ingredients or foreign color.

Each and every package of gelatine or gum ice cream must be clearly and distinctly labeled, as it is shipped out, to show what the product is. Every container in which ice cream is sold to the consumer must bear the same statement clearly and distinctly set forth separate from any other fact upon the label.

However, in a recent letter the North Dakota Chief Deputy Food Commissioner says, "Under new ruling issued by this Department, it is not necessary to state on the label that the ice cream contains gelatine or gum."

Where gelatine ice cream is dispensed prominent signs must be posted, so as to be easily read from all parts of the room stating, "GELATINE ICE CREAM SOLD HERE" or "GUM ICE CREAM."

The use of artificial coloring matter is strictly prohibited in the manufacture of ice cream to be sold in the State of North Dakota.

This ruling is made in accordance with Section 3, Articles three and four, and Section 4 of the North Dakota State Food Law, and is intended to prohibit the coloring of ice cream so as to make it appear better or richer than it otherwise would. It is not the intent of this ruling to prohibit the manufacture of colored ice cream where the coloring is vegetable and wholesome, and of such nature as to make itself clearly evident to the purchaser, as, for example, Neapolitan Ice Cream, Caramel Ice Cream, etc.

* * *

Tennessee—Standard ice cream contains not less than eight per cent milk fat and the content of milk fat and milk solids not fat combined shall be not less than eighteen per cent, except that when the ingredients of standard ice cream include eggs, fruit or fruit juices, cake, confection, cocoa, or chocolate or nuts, such reduction of the percentage of milk fat and milk solids not fat, as may be due to the addition of such ingredients shall be allowed.

For the purposes of this act ice cream shall be deemed to be adulterated:

First: If in quality or grade it is lower than the professed standard or quality or grade under which it is sold or offered for sale. (Other conditions general, see below.)

* * *

Vermont—Articles of food frozen in the form of ice cream but not conforming to the standards established by this chapter may be sold or offered for sale under any fancy, descriptive, or trade name whatsoever, except that the words, "ice cream" or "cream" shall not be a part of such name; nor appear, nor be used in any manner whatsoever in connection with such product or the sale thereof.

* * *

Washington—The term "ice milk" shall mean the frozen product made from the combination of pure, sweet milk and sugar with or without harmless coloring or flavoring matter, and containing not less than 2.4 per cent of milk fat, and not more than .6 per cent of pure and harmless vegetable gum or gelatine.

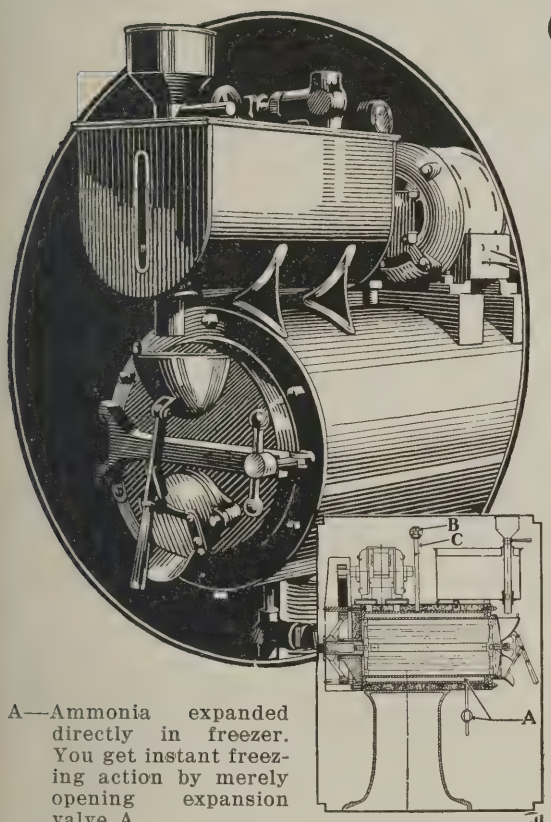
West Virginia—* * * And if any artificial coloring matters are used, this fact must be declared upon the label of the package.

All preparations not in accordance with the above shall plainly state on a label attached to the container, the ingredients and character and quantity of each, and they shall not be sold as ice cream.

* * *

Wisconsin—Twelve per cent is the milk fat standard for ice cream in Wisconsin, but fruit, nut, chocolate or cocoa, caramel and maple ice cream may contain only 10 per cent milk fat. Orange, lemon and wintergreen ice cream are also defined with 12 per cent milk fat.

* * *



Most of the state laws merely state what the milk or butterfat content of ice cream shall be and leave the other ingredients to the judgment of the manufacturers. Gelatine, total milk solids, total solids, and overrun have had the attention of the legislatures in some states. It is safe to assume, however, that all the usual ingredients of ice cream may be used in any state, whether or not the laws of that state specifically say that they may be used. For instance, in most cases ice cream is termed "a frozen product made from sweet cream or sweet milk and cream," but this does not prohibit the use of condensed or powdered milk and butter; likewise, the usual definition does not include eggs, but they may be used in ice cream, nevertheless.

However, ice cream manufacturers should guard against the use of any ingredients which, although they are not prohibited in the ice cream laws, are prohibited by the pure food laws. The Connecticut ice cream law (quoted above) furnishes an illustration. It is to be noted that the clause "provided nothing in this section shall be construed to prohibit the use of harmless colors permitted to be used in foods," does not mean exactly

(Concluded on page 11)

CONTINENTAL

Modernizes the Ice Cream Freezing Operation

Cross Section of Continental Direct Expansion Freezer

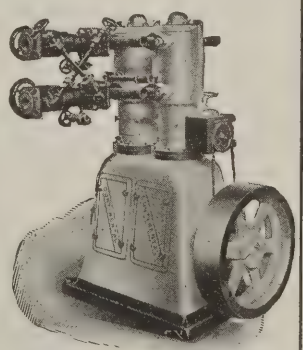
A—Ammonia expanded directly in freezer. You get instant freezing action by merely opening expansion valve A.

B—Absolute temperature control; opening or closing suction valve B regulates temperature instantly at any point desired by operator.

C—Combination temperature and pressure gauge; constantly indicates temperature maintained in freezer cylinder, thus enabling operator to know exact temperature to raise or lower it at will.

The other advantages are equally important and desirable.

THE USE of a Continental Direct Expansion Ice Cream Freezer in ice cream making, wholesale or retail, saves time and money.



With a ***Continental*** Freezer not a minute need be wasted out of a busy, profit producing day.

You can freeze 10 gallons in 10 or 15 minutes, or, 500 gallons in 8 to 10 hours from a "standing start" with direct expansion ONLY.

Only necessary to turn a valve and the freezing action starts instantly. You can adjust the freezing temperature to suit yourself—you have absolute control. No long waits as with a brine system. No slush. No pumping. No precooling of brine.

You ***do*** get higher quality, remarkable uniformity and much greater production at a pronounced lower operating cost.

See a Continental freezer operate. Speaks for itself. Designed for the ice cream maker with up-to-date ideas striving for leadership. Write us for complete and interesting particulars. It's "money in your pocket."

Also, if in the market for Compressors or Modern Refrigerating Equipment, a request will bring to your desk our Bulletin C-29 covering the superior Continental line.

Co-operative Service

Our Service Bureau and Refrigerating Engineers will glady analyze your particular problem and offer recommendations for your consideration without any obligation whatever. This department is maintained to co-operate with our customers and as an authoritative source of practical, helpful information for those interested in efficient refrigerating equipment. Put your problems up to us; if you like we'll send you a data sheet for this purpose.

Adding the Gelatine to the Mix

A Different Method For Every Manufacturer

ICE cream manufacturers like variety in methods of adding gelatine to the ice cream mix. At our request a number of ice cream manufacturers told us how they did it, and hardly any two of them carried out exactly the same practice. Following is a selection of replies to our query that give an idea of the various systems in use and cover the subject thoroughly:

Our method of adding gelatine to the mix has been to cover the required amount of gelatine with cold water and soak for about 20 minutes. Then add more water to make four (4) parts water to one part gelatine and heating to 145 degrees Fahrenheit, stirring well while heating and pouring directly into the mix while same is being pasteurized or near the same temperature as the dissolved gelatine.

We have been very successful with this method for several years. However, the past thirty days we have worked with a different method and as far as our experience goes we are getting same result. This is to add gelatine dry before pasteurized, in other words, while the cream is cold we put the coil or stirring device into motion adding the dry gelatine powder directly to the cream through a fine sieve—this while the cream is cold, then we turn the steam on and pasteurize and viscolize as usual and when vat is empty we have never found any gelatine sticking to the vat. We like this method for the following reasons:

1. Most convenient.
2. Saves time and labor.
3. Less loss from sticking to other vessels used.

* * *

We place about 100 gallons of cold milk in our pasteurizing vats and then add the required amount of gelatine, accompanied by agitation. The additional ingredients are then added and heated to 145 degrees F., and held for thirty minutes. The entire batch, sugar, gelatine and milk products are then homogenized at 2,500 pounds pressure. We believe that the addition of gelatine to the cold milk insures perfect solution and find that the 145 degrees temperature does not affect its properties as we understand that gelatine may be heated as high as 180 degrees without affecting its jellying qualities. Some manufacturers add the gelatine to the mix just before freezing but we believe that this does not allow the gelatine to accomplish one of its chief functions, that is, coating the globules of water with its film, because it has not had enough time to permeate the mass thoroughly.

* * *

We have tried various methods in a small way. We have also tried putting dry gelatine into the pasteurizer with the mix when ready to pasteurize but did not think best to subject the gelatine to 145 degrees for 30 minutes. We have tried condensing the entire mix to the proper consistency to give proper percentages of fat and total solids. This did not prove satisfactory in our case for making the mix. In subjecting gelatine to such a high degree of heat, as is necessary for condensing and for such a long time, did not seem a good practice.

We now get our gelatine into solution by adding one quart of water to every pound of gelatine. After the mix has been pasteurized and brought to the homogenizing temperature, the gelatine solution is strained into the mix and mixture homogenized. This method has given us the best results and has proven very satisfactory.

* * *

In regard to the best method of adding gelatine to the ice cream mix, I find that the best results are obtained by first soaking the gelatine in a quantity of water and then adding to the batch being pasteurized. Carry the pasteurizing temperature for the full 30 minutes then cooling to about 110 degrees and putting through the steam emulser at not less than 60 pounds steam pressure. This will raise the temperature up close to 200. We discharge from the emulser directly into our holding vat through which cold brine is constantly circulated dropping the temperature to about 65 degrees and after the batch is completely pumped over the temperature is carried down to 32.

* * *

We soak 3½ ozs. of gelatine into ½ gallon of cold water, stirring until all lumps have been removed and begins to thicken, then insert steam hose and heat to 145 degrees F., after which time we pour it into the ice cream batch which we are pasteurizing around 100 degrees, or warmer. We are having first rate success by soaking our gelatine in cold water and pouring into the heated mix.

* * *

We homogenize our entire mix excepting fruits and flavors. We add the gelatine solution to the mix, after which the mix is held at 150 degrees F. for thirty minutes before homogenizing. This gelatine solution is made by diluting the gelatine in milk, using gelatine in the approximate proportion of .4 per cent of the completed mix.

By introducing the gelatine before homogenizing, we avoid any lumps of gelatine as well as getting more even distribution through the batch. Also by holding the mix at a pasteurizing temperature after adding the gelatine, we know that the gelatine is pasteurized with the balance of the ingredients.

* * *

The method we use of adding gelatine to our mix is by adding it just before pasteurizing. We mix our water and milk powder till it is thoroughly dissolved and then sift the gelatine slowly over the coils. Heat it to 140 degrees or 145 degrees F. and hold for twenty minutes.

This method has given us very good satisfaction ond we have had very little trouble in dissolving our gelatine. We think this method is better than mixing gelatine with milk or water because it saves unnecessary labor and it is much easier to handle.

* * *

We are buying as high a grade of commercial gelatine as we can secure. We have found the bacteria content in our gelatine to be very low, and therefore have used the following method of adding to the mix:

We dissolve the gelatine in cold water and add to the mix after all other ingredients have been added and the temperature has risen in the vats about 110 degrees. After adding the gelatine we pasteurize and cool down to proper temperature for homogenizing.

* * *

We pasteurize and homogenize our entire mix, including the gelatine, and for some time we have been putting the gelatine directly into the pasteurizer in dry form just before starting to heat the batch. So far as we are able to judge this gives very satisfactory results.

The advantage of this method is that it is much simpler than cooking the gelatine separately, and there is no danger of over heating the gelatine, and we believe that the pasteurizing temperature is about right to get the best results from the gelatine.

* * *

We have tried various methods of dissolving gelatine for our mix but believe that we are having the best success in dissolving our gelatine in a sufficient amount of hot water in a double boiler and introducing into the mix at a temperature of 100 to 130 degrees F.

* * *

Our present method of adding gelatine to our ice cream mix is to mix the ground gelatine with the granulated sugar in proportions of 3½ pounds gelatine to 30 pounds sugar and add this to the hot mix. Contrary to some theories we have found that we get absolutely the full strength of the gelatine by this use.

* * *

I disolve my galatine in milk (40 oz. in 1 gal. milk), taking about one hour to dissolve it in an ice cream can set in warm water; then bring the gelatine slowly to about 120 degrees F., and stir it into the mix. It is necessary to dissolve slow to prevent curdling of the milk.

I like milk instead of water, as it seems to help to do away with granular ice cream, with which I used to have considerable trouble; also it seems to help make smoother cream.

* * *

The gelatine is added in dry form as soon as the batch reaches the proper temperature. We have found that it is unnecessary to mix it with anything else, as it dissolves very satisfactorily when added dry.

* * *

In adding gelatine to the mix, we soak the gelatine ten hours. Then add fifty gallons warm milk. Heat the whole to a temperature of 135, then add to the batch. Then heat the batch and agitate it.

* * *

We dissolve our gelatine in the hot mix before running it over the emulsion. This seems to give very satisfactory results and is very easy to do.

STATE ICE CREAM STANDARDS.

(Concluded from page 8)

what it says. There are a great many foods that are artificially colored and ice cream may also be colored in some cases, but the Connecticut pure food law says that food shall be deemed adulterated within the meaning of the law "if it be mixed, colored, powdered, coated or stained in a manner whereby damage or inferiority is concealed." Plain vanilla ice cream is a good example. If a manufacturer adds coloring to his mix in order to give the ice cream a rich creamy color, that ice cream is colored to conceal inferiority. The reason is obvious. Vanilla does not itself color (as do fruit, caramel, or chocolate for instance) the ice cream, so the color of that ice cream would be natural and would indicate the amount of cream in it. To add coloring which would give it a richer cream color than the butterfat alone would be able to give it, would, in law, be considered as concealing inferiority.

The pure food law of New Hampshire and the ice cream law of Michigan may be said to be typical laws, as every state has a law similar to one or both of these, which regulates the purity of ice cream.

The New Hampshire law says:

A food is adulterated:

(1) If any substance has been mixed with it so as to lower or injuriously affect its quality or strength.

(2) If any substance has been substituted either wholly or in part.

(3) If any valuable constituent has been removed.

(4) If it has been treated in any way (as by adding color) so as to conceal inferior quality, that is, cause the article to appear of better quality than it really is.

(5) If there is any added injurious substance.

(6) If it contains any chemical preservatives.

The Michigan law says:

Ice cream shall be deemed to be adulterated within the meaning of this act:

First, If it shall contain boric acid, formaldehyde, saccharin, or any other added substance or compound that is deleterious to health; Second, If it shall contain salts of copper, iron, oxide, ocres or any coloring substance deleterious to health: Provided, That this paragraph shall not be construed to prohibit the use of harmless coloring matter in ice cream when not used for fraudulent purposes; Third, If it shall contain any deleterious flavoring matter, or flavoring matter not true to name; Fourth, If it be an imitation of, or offered for sale under the name of another article; * *

All of the state laws use in their definitions such expressions as sweet pure milk, non-rancid butter, sound clean fruits, sound non-rancid nuts, etc., but it is hardly imaginable that any intelligent ice cream manufacturer would be even tempted to use anything else than pure, clean, sound, raw materials.

Ice cream entering into interstate commerce must comply with the law of the state into which it is to be consumed, except in cases where it is shipped into a state having no state regulations, in which case it must comply with the Federal regulations or the ordinances of the particular municipality in which it is retailed. The Federal Act is only an administrative act, and does not affect any ice cream except that entering into interstate commerce and that only when the state into which it is shipped has no standards.

This article does not, by any means, cover all of the laws relating to the ice cream industry, but merely those relating to the ingredients going into the composition of ice cream. However, we are prepared to furnish data upon any other point or it may be obtained by writing to the department of agriculture of the state in question.

WHEN SHIPPING ICE CREAM BY EXPRESS, NEVER USE A LARGER TUB THAN THE CAN REQUIRES.

From Coast to Coast Ice Cream Exposition Endorsed

Association of Ice Cream Supply Men Hears from Leading Manufacturers All Over Country.

THE Pacific and Atlantic states are joining in boosting for the National Exposition for the ice cream industry being promoted by The Association of Ice Cream Supply Men, and to be held in the $6,000,000 Cleveland Public Hall October 17th to 21st, inclusive.

Many of the strongest endorsements of the National Exposition are coming from ice cream manufacturers. The exposition will be held in conjunction with the twenty second annual convention of the National Association of Ice Cream Manufacturers.

Bert H. Walker, President of the Royal Ice Cream Company, Tacoma, Wash, recently wrote to the Association:

Association of Ice Cream Supply Men,
New York, N. Y.

Gentlemen:—I do not know of anything that makes a better impression on a person's mind than actually seeing an object, whether it be a wonderful painting, a natural landscape, a piece of machinery, or an exceptionally fine piece of merchandise to be used for any purpose of manufacture or wear.

If this is a fact, what better method could be employed in bringing to the attention of the ice cream manufacturers the different items used in their industry than the expositions promoted by The Association of Ice Cream Supply Men for the instruction and convenience of all manufacturers?

The association members are to be commended for their efforts in arranging for the National Exposition to be held in Cleveland during the week of October 16th in conjunction with the annual convention of the National Association of Ice Cream Manufacturers.

To those who do not have an opportunity of visiting the various factories and supply houses where the latest types of machinery, etc., are shown, these exhibits are quite a liberal education, as those in charge are well trained in demonstrating the qualities of their respective lines.

The visiting manufacturer wherever possible should bring his plant men with him as the valuable information gained by the man who actually does the work is worth many times the investment.

The association is entitled to the support of manufacturers who appreciate high class business methods, and the code of ethics they have adopted assures those dealing with their members the best class of merchandise procurable and the protection of the "Seal of Safety."

We wish you every success and trust we may be able to visit the "Big Show" where we are sure of seeing an instructive exhibition and meeting many friends in the supply division.

Yours very truly,
ROYAL ICE CREAM COMPANY,
(Signed) Bert H. Walker.

Jumping clear back across the continent, A. M. LeMessurier, manager of the Syracuse Ice Cream Company, Syracuse, N. Y., has also written the association:
The Association of Ice Cream Supply Men,
1328 Broadway, New York, N. Y.

Gentlemen:—The ice cream shows put on by The Association of Ice Cream Supply Men have been of inestimable value to the ice cream industry at large.

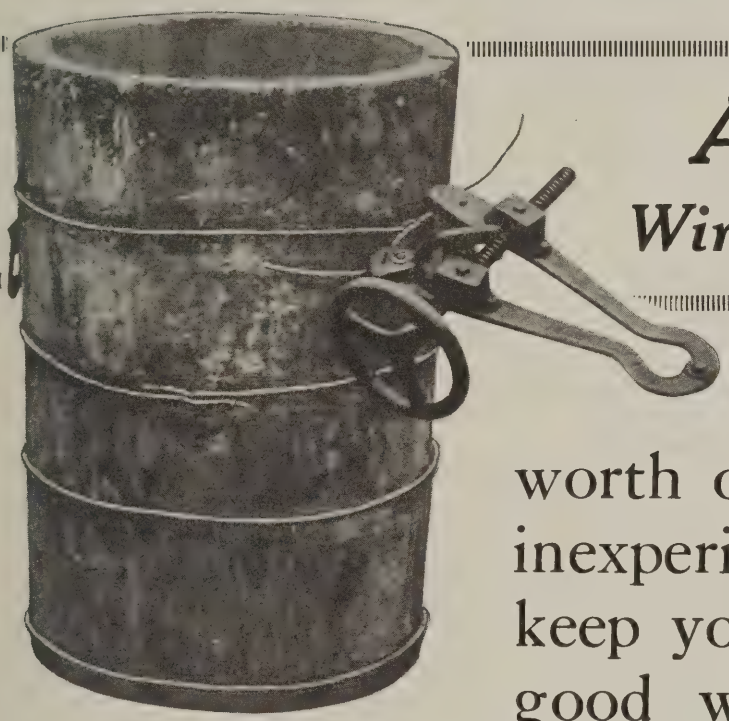
I have attended each and every one of your shows for a number of years past, and I fully believe that ice cream manufacturers who want to keep up with the latest achievements of the manufacturers of ice cream factory supplies, cannot afford to miss your shows.

It would take many miles of travel and weeks of time to visit the plants who exhibit at these shows, and I know that the large majority of manufacturers throughout the country feel very grateful to your association for having made it possible to see the valuable lines on exhibit at centered points throughout the country.

Yours very truly,
SYRACUSE ICE CREAM COMPANY,
(Signed) A. M. LeMessurier, Mgr.

Recently communications from W. M. B. Sine, general manager of the Imperial Ice Cream Company's chain of ice cream activities, and from L. M. Hendler, head of the large Hendler Creamery Company of Baltimore, similarly expressing their opinion of the value of the National Exposition to the whole industry, have been published.

According to the association, supply houses and their salesmen all over the country are predicting with convincing detail an attendance at the National Association's convention and at the National Exposition far exceeding any that has ever characterized an ice cream industrial event before.



EXTRACTS FROM DAIRYMEN'S NOTEBOOK
"GREATER LOVE HATH NO MAN."

"I love my scrub cow. She gives me employment every day in the year. She consumes my hay and grain, and grows fat and sleek. She is a thing of beauty, though a burden forever. To produce milk and butterfat would detract from her physical beauty, therefore, it is unreasonable to expect it of her. She helps to reduce my income tax. I love my scrub cow. She is a luxury. Dairymen are entitled to luxuries as well as other people. My neighbor tells me to sell her to the butcher, but my neighbor is a hard-hearted man, so is the butcher. The official tester says that the profits from three of my best producers will keep her in comfort, so why should I worry. I love my scrub cow. It requires time to milk her. My banker says that the small amount of milk she contributes can justly be called 'the milk of human kindness,' for it is human kindness that allows her to exist. Even Parson Jones was heard to remark that 'greater love hath no man than he who wears his young life away to support a scrub cow, expecting no reward, not even the respect of real dairymen.' I love my scrub cow. Who can doubt it?"

Show Me The Man who will not be benefitted by our "plan" and I'll show you a man who is not in the ice cream business.

Keep Your Old Ice Cream Tubs in Service

You Can Crate Anything With a Gilmour

A Gilmour Wire Hoop Machine

— a few cents worth of wire and an inexperienced boy can keep your old tubs in good working order.

Thousands of ice cream tubs are cast aside every year because they need a hoop in a hurry. It only takes a second or two to put on a wire hoop with a GILMOUR and anyone can use it and do a good job. Wire hoops are a lot cheaper and quicker to use than band iron. There are thousands of GILMOUR users and boosters.

Gilmour Hoop Machine Co.

Masonic Temple Bldg. **OWENSBORO, KENTUCKY**

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—Please give me the total solids of the following: 90 gallons of 35 per cent cream, 90 gallons of 3.5 per cent milk, 90 gallons of condensed, 360 lbs. of sugar, 13½ lbs. of gelatine. R. D. Co.

Reply: I am indicating below in Table No. 1 the analysis of your ice cream mix:

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
360.0 lbs. sugar	.....	.....	342.00
13.5 lbs. gelatine	.....	.....	12.80
728.0 lbs. 35% cream	254.8	42.1	296.90
774.0 lbs. 3.5% milk	27.09	66.49	93.58
810.0 lbs. plain condensed	.....	219.30	219.30
2675.0 lbs.	281.89	327.89	964.58
Per cent	10.6	12.2	36.05

I assume that the condensed milk which you mentioned was plain condensed skimmilk containing no butterfat and having 27 per cent solids.

* * *

Dear Sir:—We wish you would kindly inform us how you figure solids in the following ingredients for the purpose of standardizing the ice cream mix: cream, sweet butter, skim milk, evaporated whole milk, skim milk powder, gelatine, sugar, salt, meloine, Washburn's Improver.

We note that some writers on the standardization of ice cream mix recommend that skim milk be assumed to contain 8.9 per cent total solids. Why is this practice recommended when the State standards in some cases require as high as 9.3 per cent solids, and the analysis given in the text book is approximately 9.7 per cent.

We shall greatly appreciate this information, and anything else you may see fit to tell us regarding the standardization of ice cream. P. I. C. Co.

The method for figuring solids in cream consists first in finding the number of pounds of butterfat, subtracting this from the total number of pounds of cream we have the total pounds of milk serum and multiplying this by 8.9 per cent gives the serum solids. For instance: 30 per cent cream would have 30 pounds of butterfat in 100 pounds and 70 pounds of serum, multiplying 70 by 8.9 is 6.23, or the number of pounds of serum solids.

The average analysis for unsalted butter is usually taken as 84 per cent, the butter containing no other solids. Skim milk may be figured the same as milk serum multiplying the total pounds by 8.9.

The average analysis for evaporated whole milk is 7½ to 8 per cent butterfat and 18 per cent serum solids, the total solids being from 25.5 to 26 per cent. All the other ingredients, including skim milk powder, gelatine, sugar, etc., you can figure at 95 per cent.

The figure 8.9 per cent was arrived at from a great many analyses and actual results obtained by the Merrell Soule Milk Powder Company. I have made many analyses personally and I find that 9 per cent is a little too high to figure serum solids. The amount of solids in skim milk will vary, of course, due to many factors, the principal factor being the composition of the milk as affected by the breed of cows. It is possible to get skim milk from very rich Jersey cows that will contain as high as 10 per cent serum solids but using milk as it comes to the ice cream factory, mixed from many different herds 8.9 per cent is about correct.

Dear Sir:—I am using the following mix and cannot get no more than 10 gallons out of 7½ gallons mix. Could you please advise me immediately what can be the trouble? I would like a 100 per cent overrun. Twenty gallons 17 per cent cream, 18 oz. gelatine, 7 lbs. condensed milk, 30 lbs. sugar.

I pasteurize this at 145 degrees, cool down to 120 and then viscolize at 2300 lbs., cool in ordinary milk cans down to 45 or 50 degrees, hold for 24 hours, add 1 oz. Meloine dissolved in water and sugar ½ hour before freezing; cool brine down to about between 10 and 12 degrees above zero.

Out of this mix all I can get is 30 gallons finished ice cream. I have the cream separated by the farmers at about 30 per cent and I reduce down the cream with sweet milk testing 4 per cent. I have a second-hand brine freezer which was just overhauled by the factory. P. M.

Reply: I have analyzed your formula as you will find below in Table One:

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
20 gal. or 168.0 lbs. 17% cream	28.56	12.41	40.97
7.0 lbs. condensed	.....	1.89	1.89
30.0 lbs. sugar	.....	.....	28.50
1.2 lbs. gelatine	.....	.....	1.14
206.2 lbs.	28.56	14.30	72.50
Per cent	13.7	6.94	35.0

Many ice cream makers use a similar formula and have no difficulty in securing plenty of swell. Your trouble may be caused by freezing your mix too soon after processing and not holding it at a low enough temperature before freezing. I suggest that you try holding your mix 48 hours instead of 24 to cool to 35 or 40 degrees instead of 45 or 50.

Then again, your freezer may be the cause of the low overrun. You stated you had a second-hand machine and in rebuilding this machine it probably was not geared correctly. Running the freezer with a brine temperature of 10 or 12 degrees should freeze a batch in 12 to 15 minutes. I suggest you try running the freezer using a smaller load and see if you can't get more overrun.

* * *

Dear Sir:—A South Dakota customer writes for suggestions for using 8 per cent sweetened condensed, containing 8 per cent butterfat, 22 per cent serum solids and 42 per cent cane sugar.

He wants to use it with sweet butter. We have suggested to him that sweetened skim would be more economical for him, since he makes his own sweet butter.

We are often asked for directions for use of our sweetened condensed. Do you publish a book containing receipts and directions for using condensed milk of all kinds in the various combinations which come up in different mixes?

We think what our South Dakota friend wants is suggestions on the preparation of the mix, rather than simply a formula of ingredients. P. M. P. Co.

Reply: I am sure that your customer would secure just as good results at less cost if he used sweetened condensed skim milk rather than the butterfat product, as long as he is able to secure his butterfat at a reasonable price.

I am sorry that we do not have a book published which gives various formulas and methods on the use of condensed milk in ice cream, but its use is very simple and your customer should have no difficulty in mixing it with butter and skim milk or mixing it with but-

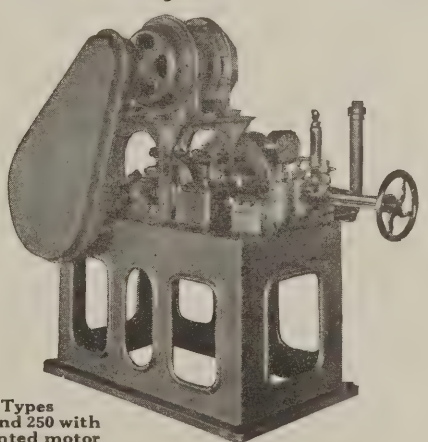
Southern Representative: BLANKE MFG. & SUPPLY CO., St. Louis, Mo.

ter and water to secure a satisfactory mix. All he will have to do will be to carefully calculate the amount necessary for the proper amount of serum solids in connection with the butter in the mix. If your customer will write me a personal letter telling just what kind of a mix he desires, I shall be glad to figure it out for him.

* * *

Dear Sir:—We are in receipt of a copy of a letter written by you to the ———, whom we had asked for information on the use of condensed milk in ice cream.

As per your letter we are writing you for information. Our object for trying the condensed material in either form (skim or 8 per cent) in our case is that we might improve our flavor. We, all through the season last year, used a mix of sweet butter water and milk powder, and had fine luck, but this season, with the same mix and everything seemingly equal, our flavor is off, it seeming to be of a dead or flat nature. We thought probably condensed milk of some form might help this or possibly fresh cream, but the latter, of good quality in any amount, is not very easily obtainable.



We would greatly appreciate any help or suggestions you can give us that you think will benefit us in our trouble, and possibly if you think that the condensed product will help our case you can work us out a formula to use with sweet butter and water.

Our mix at present contains 14 per cent fat, 34 per cent total solids and 13 per cent sugar. T. A. C.

Reply: It is possible that the difference in flavor you have this season is due to the quality of milk powder rather than for any other reason. In order to get a good flavored article from entirely reconstructed materials it is necessary that the quality of the powder be first-class and also that the powder be fresh and sweet.

The Gaulin Homogenizer

Is Preferred by Ice Cream Makers

Types 100 and 250 with mounted motor

ICE cream manufacturers who take the trouble to investigate, invariably prefer the Gaulin Homogenizer. It is constructed of as excellent materials and with the same painstaking care as is the finest automobile.

This is one reason why the product homogenized is unexcelled in quality and why the machine gives good service for many years.

Write for free booklet "The Story of the Homogenizer."

See Other Advertisement for Lists of Sales Branches

PROSPERITY FOLLOWS THE DAIRY COW — Be sure you attend the National Dairy Exposition, St. Paul, October 7-14, Minneapolis.

DON'T TRY TO SAVE MONEY BY USING CHEAP LUBRICANTS.

A very slight rancidity in the powder will leave its effect in the flavor of the ice cream.

If it is possible for you to obtain some fresh cream you would improve the flavor of your ice cream considerably even if you use only a small amount of cream with the butter and powder mixture. I suggest, however, that you try the mixture given below in Table One, using the sweetened condensed whole milk along with some skim milk powder and see if that will improve the flavor:

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
6.6 lbs. sugar	.....	.....	6.27
.5 lbs. gelatine	.....	.....	.47
16.0 lbs. 8% sweet condensed	1.28	4.32	12.00
15.2 lbs. 84% butter	12.76	.....	12.76
4.0 lbs. skimmilk powder	.....	3.80	3.80
57.7 lbs. water	.....	.....	.....
100.0 lbs.	14.04	8.12	36.30

I shall be glad to have you write me as many times as you desire until you have your mix as you want it.

* * *

Dear Sir:—Will you please give me a formula for 100 lbs. of mix containing milk, cream, condensed milk, sugar, gelatine, flavor, to give about 15 to 18 per cent fat? What would be the proportions if skim milk were used instead of whole milk?

Our milk varies from 3 to 3.5 per cent, cream from 45 to 50 per cent, condensed milk contains 9 to 10 per cent fat and 42 per cent sugar.

We are using a vertical freezer with brine box and get our brine temperature about 10 degrees F, and it freezes in 15 to 20 minutes. Our swell is 50 per cent only and we do not seem able to get more; we should like at least 75 per cent. Is it useful to vary the speed of the dasher during freezing? Is it desirable or otherwise to keep brine flow even during freezing?

We do not at present homogenize, nor do we age our mix, but we are fixing up a plant to make 10 tons of ice per day and want to do a real top hole ice cream and brick business, and any suggestions will be most thankfully received, as it is difficult to get information here as everyone is doing differently and what one says is good another says is the worst possible to do. We do not get together as you do in the States; I wish we did. We have done well so far this season and customers prefer our cream ices to other makes, but our profit is very small owing to the small swell. I wish that I could spare the time to run over the "puddle" and go through one or two of the plants, as I know it would be very instructive. I have been over some of the milk plants in New York and received the very greatest kindness. I am not a Wolf Hound or a Dixie Flyer, but I dined one day with the Schwine Fressers in the Bronx and still feel proud about it. G. S. C. (England.)

Reply: We have your letter of recent date, with a request for a formula for a 100 pounds of mix, using the ingredients suggested in your letter, namely, whole milk, cream, sugar and condensed milk. I am suggesting below in table one, a formula containing 14 per cent sugar, about 15 per cent fat and about 10 per cent serum solids. This will make a product containing a very high per cent of solids, but I am sure you would get satisfactory results:

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
7.3 lbs. sugar	.....	.....	6.91
.5 lbs. gelatine	.....	.....	.47
16.0 lbs. sweet condensed	1.44	4.32	12.48
28.00 lbs. 45% cream	12.60	1.38	13.98
48.20 lbs. 3% milk	1.44	4.2	5.64
100.0 lbs.	15.48	9.90	39.48

In table two below I am suggesting another mix with about 15 per cent fat but with considerably less condensed milk. You will probably prefer the mix in table two:

Table Two.

Ingredients	Fat	Serum Sol.	Total Sol.
10.6 lbs. sugar	.....	.....	10.07
.5 lbs. gelatine	.....	.....	.47
8.0 lbs. sweet condensed	0.72	2.16	6.28
30.0 lbs. 50% cream	15.00	1.35	16.35
50.9 lbs. skimmilk	.....	4.58	4.58
100.0 lbs.	15.72	8.09	37.75

I do not quite see your point in trying to make ice cream containing as high as 18 per cent butterfat. Here in the States our ice cream does not average much over 10 per cent butterfat and our trade likes this kind of cream much better than the high butterfat cream.

We also notice that you have difficulty in securing a satisfactory overrun with your vertical type of freezer. We find here in the States that our ice cream factories using the vertical type machine seem to have a great deal more difficulty in securing the overrun than with a horizontal machine. You ought to get at least 75 to 100 per cent overrun, using either of the two mixes suggested above. My opinion is that you are consuming too much time to freeze a batch, and I suggest that you try to get the brine temperature down to 5 or 8 degrees F. and try to freeze a batch in no longer than twelve minutes. It is possible when you freeze your mix twenty minutes you beat out considerable air which you had in the mix had you completed the freezing in less time. It is not practical to vary the speed of the dasher during freezing but rather to standardize the overrun by regulating the brine flow and temperature of the brine and watching carefully the consistency and weight of the ice cream when drawn from the freezer.

* * *

Dear Sir:—We are going into the ice cream business here in Missouri and we want to get the right kind of a start and put out a quality product, so we are writing you asking that you give us a couple of good standard formulas. We expect to put out at least a 14 per cent ice cream, and possibly a 16 per cent. We would like your opinion in regard to the 16 per cent.

We expect to use a tub freezer the balance of this season and would like to know if we can connect this up and freeze with brine instead of the ice and salt mixture?

Which do you consider the best for body in the cream, skim milk powder or condensed milk? L. A. S.

Reply: I am suggesting below, in table one, a 14 per cent butterfat mix which I am sure would give you good results in competition with other factories in Missouri. You probably know that the State of Missouri only requires 8 per cent butterfat. My experience has been that consumers prefer a product which is not too rich in fat. With 14 per cent fat it is hardly necessary to

"Carry-Home" Sales

Filling Sealright Liquid-Tight Paper Containers with bulk ice cream direct from the freezers, or, by Sealright Filling Machines—a method nationally known as the "Sealright-Way"—and already adopted in 44 States, has proven itself a positive stimulation to increased "carry-home" sales of bulk ice cream. Surely, you want to enjoy the larger volume of business to be derived from the potential possibilities in this field, heretofore never fully developed.

Gentlemen:- Attention Mr. J. J. Mojonnier.

We have been using your ice cream packaging machine, since July, 1921, and we have been making all of our brick ice cream by your method from that time. We feel that with the new liner and the improvements that you have made upon your present machine that you have absolutely solved the problem of packaging ice cream directly into the carton. Our brick business is now greater than it ever has been, and is on the increase. We attribute this largely to the splendid package that we are enabled to put out with our machine. Every quart is a full quart. The bricks do not rattle in our package. The cream is of far better texture and more like bulk cream than our brick cream made by the old method. The lines on the three flavored bricks are always much better than we were ever able to make by hand.

We believe that one of the finest features of ice cream packaged in this way is that the cream is hermetically sealed upon all six sides in pure vegetable parchment from the time it leaves the freezer until it is opened in the consumer's home.

We would not think of ever going back to the old method of packaging ice cream.

We recommend your machine with great pleasure.

Very truly yours,
LAWRENCE ICE CREAM COMPANY,
By
President.

Dear Sir:

Attention Mr. Timothy Mojonnier.

It gives me pleasure to recommend to other users of your machine its particular advantages and usefulness covers a long felt need in the matter of placing before the public a small, sanitary package which we probably could not have gotten had it not been for this sanitary package.

We find the machine easy to operate, and also unusual care or any great amount of repairs. We should not require of it is a good, sturdy machine, and should not require before the public a small, sanitary package which we probably could not have gotten had it not been for this sanitary package.

We find that it is a good, sturdy machine, and also unusual care or any great amount of repairs. We should not require of it is a good, sturdy machine, and should not require before the public a small, sanitary package which we probably could not have gotten had it not been for this sanitary package.

We feel that during the dull season in particular that we will be able to hold our sales through its use better than heretofore.

Very truly yours,

EVD/JSC.

"Just The Thing We Need!"

MATOT EVER-KEEP PACKAGE CREAM FREEZER

Why?

Because—

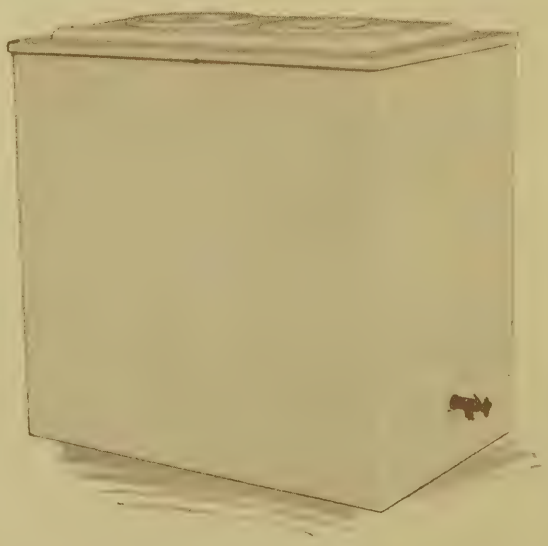
Packaged cream of any selected flavor is instantly dispensed right from the coldest part of the freezer—no fumbling around for the flavor wanted.

The oldest cream is always dispensed first.

Zero temperature—no soft cream.

Keeps cream in perfect condition—a valuable asset for increasing the carry home trade.

Freezer accommodates packaged cream in any form—bricks, eskimo pies, cylindrical packages in quarts, pints, etc. Where necessary special size containers are made.



Cream container proper consists of a centrally located receptacle surrounded by ice on all four sides, top and bottom, and is arranged to provide individual compartments for cream of various flavors.

We guarantee these Ever-Keep Freezers if iced properly once in 24 to 36 hours to keep cream in most perfect shape.

Ever-Keep Freezers are carried in stock in 32, 40, 48, 56, 60 and 70 quart capacity.

Patented Jan. 24, 1922

A full line of non-equaled ice cream cabinets, corkboard insulation, metal lined, Everlasting Redwood exteriors carried in stock in all sizes. Stock finish is golden oak. Can be furnished in mahogany, white enameled or any other finish desired.

LAURENS CO-OPERATIVE CREAMERY CO. TO MAKE ICE CREAM.

The Laurens Co-operative Creamery Company, which has plans under way for the erection of a new plant at Laurens, Iowa, will include in their new machinery equipment for the manufacture of ice cream.

This firm is capitalized at $20,000. The officers are Thomas Edge, president; R. V. Neville, secretary and treasurer; R. Rouse, L. Ferguson, J. R. Davidson, G. Ashenbrenner, M. Hertz, directors. F. Johnson will be buttermaker and general manager.

The new building will be 32 by 80 feet in size. It is expected that it will be in operation by November first.

ICE CREAM CONE PLANT FIRE DOES $100,000 DAMAGE.

A fire which did damage estimated at $100,000 swept the fifth and sixth floors of the A. Jacovilli ice cream cone manufacturing plant at Philadelphia recently. It is believed that the fire was caused by explosion of gas used in the operation of the cone-making machine.

Huge quantities of flour, sugar and other materials stored in the building were ruined by the smoke and water.

AMERICA.

"God built Him a continent of glory and filled it with treasures untold. He carpeted it with soft rolling prairies and pillared it with thundering mountains. He studded it with soft-flowing fountains and traced it with long, winding streams. He graced it with deep-shadowed forests and filled it with song.

"Then He called unto a thousand peoples and summoned the bravest among them. They came from the ends of the earth, each bearing a gift and a hope. The glow of adventure was in their eyes, and in their souls the glory of hope.

"And out of the bounty of the earth and the labors of man, out of the longings of hearts and the prayers of souls, out of the memories of age and the hopes of the world, God fashioned a nation of love, blessed it with purpose sublime and called it America."—Rabbi Abra Hillel Silver.

BEAVER ICE CREAM COMPANY NOW IN NEW PLANT.

The Beaver Ice Cream Company, formerly located at Beaver Dam Junction, Wisconsin, has recently moved into new quarters at Beaver Dam. A new building was constructed, 26 by 30 feet, which houses the entire plant. Practically all new machinery has been installed, including an ice machine. An ice house was also erected, where ice for packing and shipping ice cream is stored during the summer season. The plant has a capacity of 700 gallons of ice cream a day.

SANI-DAIRY PRODUCTS CORPORATION, 45th and Evans Ave., CHICAGO

Wisconsin Supreme Court Upholds Constitutionality of "Filled Milk" Law

STATE OF WISCONSIN,
In Supreme Court.

State of Wisconsin Upon the Relation of Carnation Milk Products Company, a Corporation, and The Hebe Company, a Corporation,
Plaintiffs.

vs.

J. Q. Emery, as Dairy and Food Commissioner of the State of Wisconsin,
Defendant.

An action under the original jurisdiction of this court, upon the relation of the plaintiff corporations to enjoin the defendants from enforcing the provisions of Chapter 409, of the Laws of 1921, this state, as against the plaintiffs, so far as the same applies to the manufacture and sale by the plaintiffs of the product known as "Hebe."

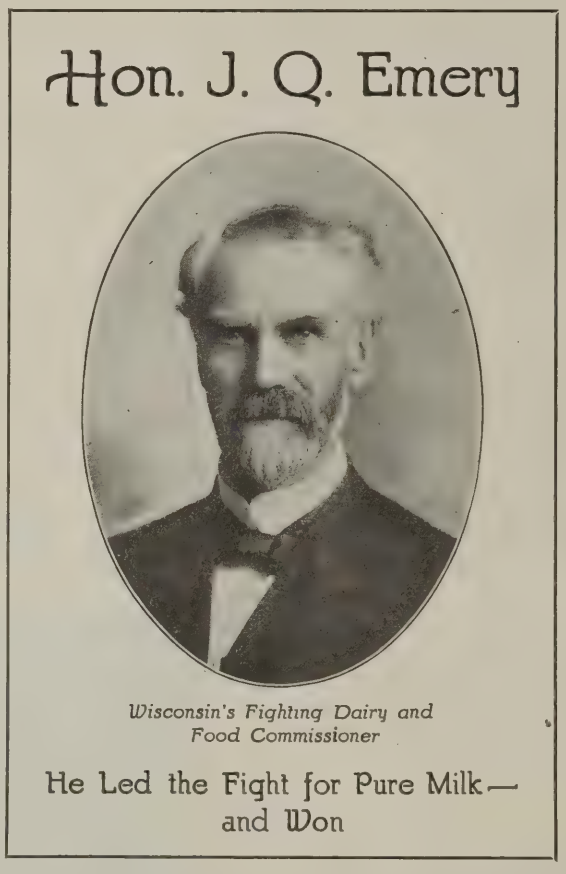
Upon the filing of the complaint, an answer was served, raising certain issues of fact, which were referred to a referee for his findings. Chapter 409, in so far as it affects the plaintiffs, is as follows:

"2. It shall be unlawful for any person, firm or corporation, by himself, his servant or agent, or as the servant or agent of another, to manufacture, sell or exchange, or have in possession with intent to sell or exchange, any milk, cream, skimmilk, buttermilk, condensed or evaporated milk, powdered milk, condensed skimmilk, or any of the fluid derivatives of any of them to which has been added any fat or oil other than milk fat, either under the name of said products or articles or the derivatives thereof or under any fictitious or trade name whatsoever."

The plaintiffs manufacture and have in their possession for sale, Hebe, which is a compound composed chiefly of milk from which the butterfat has been extracted and cocoanut oil injected in place of the butterfat.

Plaintiffs contend that this provision of law as applied to their business is in contravention to the Fourteenth Amendment to the Constitution of the United States, and similar provisions of the state constitution, and to the commerce clause of the federal constitution.

Hebe is manufactured by the Carnation Milk Products Company in Wisconsin, and its entire product sold to The Hebe Company. The Hebe Company sells the compound to jobbers and wholesalers only. The compound contains 92.3 per cent skimmed milk or buttermilk, and 7-8 per cent of cocoanut oil similarly evaporated as condensed milk. It is similar in taste, color, appearance, consistency and manner of packing to evaporated milk. The butterfat extracted from the milk is much more expensive than the cocoanut oil injected into the milk to take the place of the butterfat. Hebe can therefore be sold, and is sold, to wholesalers and retailers cheaper than the genuine evaporated or condensed milk.



The compound has been manufactured in the state for the last five years, while condensed or evaporated milk has been manufactured and on the market for the last twenty-five or thirty years. The compound is not deleterious in itself, but is not of the same quality or food value as the genuine evaporated milk. It is lacking in a certain chemical substance known as Vitamines A, which are essential elements of a proper dietary. These Vitamines may be supplied by other foods. It is admitted that the compound is not a proper substitute for the genuine for infants.

Hebe has been extensively advertised as a substitute for milk, through the press and magazines, and by means of cook books prepared by The Hebe Company. It has been advertised in the newspapers of Wisconsin as "milk," "milk compound" and "compound of milk." It has been sold by retailers in Wisconsin as "milk" or "evaporated milk."

There have also been advertised and sold four other similar compounds in the state of Wisconsin, either as "milk" or "compound of milk." These compounds are also shipped out of the state and advertised and sold in other states as substitutes for evaporated milk.

In some cases the compounds are sold by the retailers at the same price as the genuine evaporated milk. The compounds have been variously labeled at different times to indicate that they were more or less equivalent to or better than the genuine evaporated milk. At the time of the commencement of this action, Hebe was labeled: "A COMPOUND OF EVAPORATED SKIMMED MILK AND VEGETABLE FAT. Contains 7.8% Vegetable Fat, 25.5% Total Solids." On the margin of the label was printed: "FOR COOKING AND BAKING—Do Not Use in Place of Milk for Infants."

The Carnation Milk Products Company has an investment in its plants in Wisconsin of about $650,000, and of this about $50,000 in its plants is used for the manufacture of Hebe.

I.

CROWNHART, J. It is but trite to say that the constitution of our state is the supreme law. Therein will be found the powers of the executive, legislative and judicial branches of government, each supreme in its field but coordinate in their sources of powers and the exercise thereof.

The greatest deference must be paid by each department to the other acting within the scope of its powers. Any usurpation of power by one department at the expense of another is a wrong against the people who adopted the constitution as their charter of liberties and rights.

To the legislature was given the power to enact laws not in contravention to the constitution. A law so enacted becomes the public policy of the state. BORGNIS. v. FALK COMPANY, 147 Wis., p. 351.

Before a statute can be said to be unconstitutional the statute must lack in public purpose "so clear and palpable as to be perceptible to the mind at first blush" so said the great Chief Justice Dixon, who sat in the constitutionel convention and helped frame the charter of our state. BRODHEAD v. MILWAUKEE, 19 Wis., p. 686. "We must bear in mind," said Chief Justice Winslow, "the well established principle that it (the statute) must be sustained unless it is clear beyond reasonable question that it violates some constitutional limitation or prohibition." BORGNIS v. FALK COMPANY, 147 Wis., p. 348. "The rule of all courts," said Justice Bardeen, "is that a statute will be declared unconstitutional only when it is shown beyond reasonable doubt that it conflicts with the fundamental law. It is equally true that the courts will seek every reasonable mode of reconciliation of the statute with the constitution, and it is only when reconciliation has been found impossible that it will be declared void." STATE EX REL HICKS v. STEVENS, 112 Wis., p. 172. Said Mr. Justice Dodge: "We must and do concede to the legislative branch of the government the fullest exercise of discretion within the realm of reason, and, if a public purpose can be conceived which might rationally be deemed to justify the act, the court cannot further weigh the adequacy of the need or the wisdom of the method." STATE EX REL ZILLMER v. KREUTZBERG, 114 Wis., p. 549. The courts will presume in favor of the constitution-

ality of the acts in a case of doubt and sustain them. STATE EX REL BRAYTON v. MERRIMAN, 6 Wis., 14; SMITH v. MARINER, 5 Wis., p. 541; IN RE OLIVER, 17 Wis., p. 681; STATE EX REL KELLOGG v. CURRENS, 111 Wis., p. 431; NORTHWESTERN NATIONAL BANK OF SUPERIOR v. CITY OF SUPERIOR, 103 Wis., p. 43.

The United States Supreme Court has declared equally emphatically in favor of sustaining acts of Congress and the statutes of states. PRICE v. ILLINOIS, 238 U. S., p. 446; RAST v. VAN DEMAN & L. CO., 240 U. S., p. 357; HEBE CO. v. SHAW, 248 U. S., p. 303.

COOLEY ON CONSTITUTIONAL LIMITATIONS, page 238, says:

"The rule of law upon this subject appears to be, that, except where the constitution has imposed limits upon the legislative power, it must be considered as practically absolute, whether it operate according to natural justice or not in any particular case. The courts are not the guardians of the rights of the people of the State, except as those rights are secured by some constitutional provision which comes within the judicial cognizance. The protection against unwise or oppressive legislation, within constitutional bounds, is by an appeal to the justice and patriotism of the representatives of the people. If this fail, the people in their sovereign capacity can correct the evil; but courts cannot assume their rights. The judiciary can only arrest the execution of a statute when it conflicts with the constitution. It cannot run a race of opinions upon points of right, reason and expediency with the law-making power. Any legislative act which does not encroach upon the powers apportioned to the other departments of the government, being prima facie valid, must be enforced, unless restrictions upon the legislative authority can be pointed out in the constitution, and the case shown to come within them."

Again, on page 239:

IF IT'S BUNK — IT COSTS YOU NOTHING
IF IT'S TRUE — THEN YOUR PROFITS INCREASE

Have you had your "Goody-Good!" plan? Yours for the asking.

ST. LOUIS AWNING & TENT CO.
ST. LOUIS, MISSOURI

"Nor are the courts at liberty to declare an act void, because in their opinion it is opposed to a **spirit** supposed to pervade the constitution, but not expressed in words."

II.

The act sought to be avoided was passed in the exercise of the police power of the state.

The police power covers all matters having a reasonable relation to the protection of the public health, safety or welfare. McLEAN v. ARKANSAS, 211 U. S., 539.

As applied to food, this authority extends to requiring a fixed minimum amount of nutritional elements. HUTCHINSON ICE CREAM COMPANY v. IOWA, 242 U. S. 153; HEBE COMPANY v. SHAW, 248 U. S. 297.

The police power also has an especially appropriate field of action in the prevention of fraud and deception. HALL v. GEIGER-JONES COMPANY, 242 U. S. 539.

It may be legitimately exercised against even the occasional fraud not inherent in the business or product, and a **fortiori** against the fraud that is inherent in it. MERRICK v. HALSEY COMPANY, 242 U. S. 568.

It extends farther, and embraces the right to prohibit all things which constitute obstacles to a greater public welfare (RAST v. VAN DEMAN & LEWIS, 240 U. S. 342) and to do whatever will promote the general convenience or the general prosperity (BACON v. WALKER, 204 U. S. 311), including even such matters as the preservation of the reputation of a great industry of the state against injury in markets outside of the state. (SLIGH v. KIRKWOOD, 237 U. S. 52.)

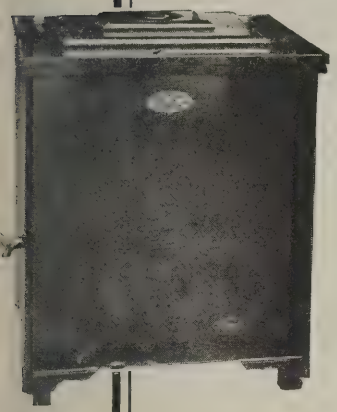
Given a legitimate subject for the exercise of the police power, it is for the legislature to adopt such measures as it may deem necessary to make its action effective, so long as they have reasonable relation to that end. PURITY EXTRACT CO. v. LYNCH, 226 U. S. 192.

The measures which the legislature may adopt for such purpose may be either regulatory or prohibitory, whichever the legislature deems the more effective method of accomplishing the result (SILZ v. HESTERBERG, 211 U. S. 31), and they may be either in the form of general directions or of detailed measures against a particular article (PRICE v. ILLINOIS, 238 U. S. 448).

Accordingly, the authority of the legislature to prohibit an article is not affected by the fact that the article may be truthfully labeled (HEBE CO. v. SHAW, 248 U. S. 297) or that the law will result in destroying the value of property devoted to the manufacture of such article (MUGLER v. KANSAS, 123 U. S. 123).

"At an early day it (the police power) was held to embrace every law or statute which concerns the whole or any part of the people, whether it related to their rights or duties, whether it respected them as men or citizens of the state, whether in their public or private relations, whether it related to the rights of persons or property of the public or any individual within the state. New York v. Miln, 11 Pet. 102, 139. The police power, in its broadest sense, includes all legislation and almost every function of civil government. Barbier v. Connolly, 113 U. S. 27. It is not subject to definite limitations, but is co-extensive with the necessities of the case and the safeguards of public interest Camfield v. United States, 167 U. S. 518, 524. It embraces regulations designed to promote public convenience or the general prosperity or welfare, as well as those specifically intended to promote the public safety or the public health. Chicago, B. & Q. R. Co. v. Illinois, 200 U. S. 561, 592. In one of the latest utterances of this court upon the subject, it was said: 'Whether it is a valid exercise of the police power is the question in the case, and that power we have defined, as far as it is capable of being defined by general words, a number of times. It is not susceptible of circumstantial precision. It extends, we have said, not only to regulations which promote the public health, morals, and safety, but to those which promote the public convenience or the general prosperity. . . . And further, 'It is the most essential of powers, at times the most insistent, and always one of the least limitable of the powers of government,' Eubank v. Richmond, 226 U. S. 137." SLIGH v. KIRKWOOD, 237 U. S. p. 59.

It is competent for the legislature to exercise all legislative power not forbidden by the constitution or delegated to the general government, or prohibitd by the constitution of the United States. BUSHNELL v. BELOIT, 10 Wis. 195.



Mr. Justice Timlin said: "We must start with the axiom that the legislature has all legislative power not withheld or limited by the constitution of the state or the exercise of which is not prohibited by the federal constitution." NITKA v. W. U. TEL. CO., 149 Wis. 110.

The police power of a state is as broad and as plenary as the taxing power. BITTENHAUS v. JOHNSTON, 92 Wis. 588.

The police power is a broad and comprehensive power, by which the rights of an individual, both as to his liberty and his enjoyment of property, may be curtailed in the interest of the public welfare, but it is not easy of accurate definition. HUBER V. MERKEL, 117 Wis. 366.

As was said by Mr. Justice Dodge: "By a long line of decisions and consensus therein by the people of the various states, it has become settled that thereby all powers of a legislative character ordinarily enjoyed by sovereign govern-

ments became vested in the state legislature, except so far as restrained expressly or by substantially necessary implication elsewhere in the constitution." STATE EX REL ZILLMER v. KREUTZBERB, 114 Wis., p. 532.

III.

History of Legislation Relating to Filled Milk.

We submit a history of legislation relating to filled milk. It has been held that where the objection to the constitutionality of a statute turns on the question as to its reasonableness under the police power, such history may be very persuasive. Certainly on the question of whether it is a debatable subject, it is peritnent to know that the matter has been generally debated. ADAMS v. MILWAUKEE, 144 Wis. 371; PURITY EXTRACT CO. v. LYNCH, 226 U. S., p. 204; MULLER v. OREGON, 208 U. S. 412.

As was said in the latter case: "When a question of fact is debated and debatable, and the extent to which a special constitutional limitation goes is affected by the truth in respect to that fact, a widespread and long continued belief concerning it is worthy of consideration."

It was said by Mr. Justice Holmes, in NOBLE STATE BANK v. HASKELL, 219 U. S. 104, speaking of the police power of a state: "It may be put forth in aid of what is sanctioned by usage, or held by the prevailing morality, or strong and preponderant opinion to be greatly and immediately necessary to the public welfare." And it has been well said, what we know as men we cannot ignore as judges; that is, we will consider matters of common knowledge without proof.

The laws prohibiting filled milk, now in force, are of three general types:

1. Laws which directly prohibit the manufacture and sale of filled milk. Of this type are the laws of New Jersey, New York and Wisconsin.

2. Laws which prescribe standards for condensed or evaporated milk which have the effect of prohibiting the manufacture and sale of filled milk. Of this type are the laws of Colorado, Connecticut, Florida, Maryland and Ohio.

3. Laws which permit filled milk to be sold as "imitation milk" under restrictions to prevent fraud. These restrictions are so severe as to be practically prohibitive. These are the laws of California, Oregon and Utah.

The Bureau of Animal Industry of the U. S. Department of Agriculture, in a bulletin on "Legal Standards for Dairy Products," issued in 1919 as a typewritten bulletin, lists thirty-one states as having standards for condensed or evaporated milk, which were adopted either by an act of the legislature or by some administrative body under legislative authority, which prescribe the percentage of solids and butterfats. These states are Arizona, California, Colorado, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Nevada, New Hampshire, New York, North Carolina, North Dakota, Ohio, Oregon, Rhode Island, South Dakota, Utah, Vermont, Virginia, Washington, Wisconsin, Wyoming. In addition to the states listed in this bulletin, Connecticut and Florida have laws prescribing standards for condensed milk.

Congress has before it a prohibitory bill which has passed the House 250 to 40.

History of Bill in Our Legislature.

The legislative records show that the bill was thoroughly considered before committees of each house; that substitute amendments were offered for regulation in each house, which were defeated by large majorities; that the bill came up in each house by special order, which denotes special consideration.

The bill was passed in the assembly by a vote of 67 to 10, and in the senate by a vote of 28 to 0.

The bill was signed by the Governor, who himself is a lawyer and has been Attorney General of the state. The legislative members and the Governor are bound by the same oath to support the constitution as are the members of this court. Their well considered action should have great weight according to judicial authority.

It will be seen that the compounds have been considered inimical to the public welfare by a large portion of the people of this country. We must conclude that there must have been some reasonable basis to induce legislation of this kind by so many different bodies.

IV.

We now come to a recognized judicial authority on the subject, which finally settles the question so far as the federal constitution is concerned.

The "Hebe" Company shipped some of its product manufactured in Wisconsin into Ohio for sale in that state. The sale being forbidden in that state by statute, the question of the validity of the statute was raised in the United States District Court for Ohio, and passed upon by three judges sitting at the trial. The statute was upheld. The "Hebe" Company then took the case to the United States Supreme Court, and there the statute was again upheld. In the United States Supreme Court the contention was made, as here, that the statute was in contravention to the Fourteenth Amendment. As there is no corresponding provision in our state constitution that goes so far to sustain the rights of property as the Fourteenth Amendment of the federal constitution, that decision is decisive of the case here if it is followed. While this court has the right to differ from the Supreme Court of the United States on this question, it will not do so on the construction of the federal constitution. Of the twelve federal judges passing on the subject, three Supreme judges dissented, but not upon the validity of the statute but on its construction as to whether it applied to the case before them.

The United States Supreme Court, in HEBE CO. v. SHAW, 248 U. S., p. 303, said:

> "The purposes to secure a certain minimum of nutritive elements and to prevent fraud may be carried out in this way even though condensed skimmed milk and Hebe both should be admitted ot be wholesome. The power of the legislature 'is not to be denied simply because some innocent articles or transactions may be found within the prescribed class. The inquiry must be whether, considering the end in view, the statute passes the bounds of reason and assumes the character of a merely arbitrary fiat.' PURITY EXTRACT & TONIC CO. v. LYNCH 226 U. S., p. 204. If the character or effect of the article as intended to be used 'be debatable, the legislature is entitled to its own judgment, and that judgment is not to be superseded by the verdict of a jury,' or, we may add, by the personal opinion of judges, 'upon the issue which the legislature has decided.' PRICE v. ILLINOIS, 238 U. S., p. 452; RAST v. VAN DEMAN & L. CO., 240 U. S. 342. The answer to the inquiry is that the provisions are of a kind familiar to legislation and often sustained, and that it is impossible for this court to say that they might not be believed to be necessary in order to accomplish the desired ends."

As was said by Mr. Justice Dodge:

> "The reasons for a given statute are for the legislature, if there are any which can fairly have weight. They are not for the courts. The latter have no control over the validity of a law unless they can say with substantial certainty that no argument or consideration of public policy exists which could have weight with any reasonable and honest man. If any such argument or reason can be suggested, its weight or sufficiency is not debatable in the courts. The existence of legitimate and adequate reasons for any law should not lightly be denied. MODERNIZATION

Ice Cream and Dairy Plants Can Be Modernized While Under Operation

WHEN your plant can not produce more goods than you can sell--when new business can not be taken on--production facilities should be increased. In many cases complete new buildings must be provided; in others, however, it may be possible and advisable to convert old dairies or ice cream factories into efficient, well-equipped plants.

Modernization can often be accomplished by additions to old buildings, or by completely revamping the old plant, conserving such of the old buildings as may be used to advantage in the new layout. A careful study of each particular situation will best determine what proceedure should be followed.

We have modernized dairy plants and ice cream factories for many concerns. In each instance we studied the problems from the operating standpoint, prepared plans for the improvements and the construction was executed by local contractors.

If you are confronted with building or production problems, regardless of their nature, consult the McCORMICK organization. Our long experience in handling the most difficult and complicated ice cream and dairy plant problems may prove invaluable to you. An interview does not obligate you in any way. Just write us that you are interested.

THE TROUBLE WITH SOME BUSINESS MEN IS THEY ARE NOT SET TO GO.

minds differ, and what may seem inadequate or irrelevant to one may seem cogent to another. One is not justified, therefore, in assuming that all who differ from him are unreasonable or are not acting in good faith. It is from such considerations as these that the courts have laid down for themselves the rule that only in a clear case—clear beyond reasonable doubt—will they venture to assert that a law is without reason to support either its purpose or the classifications it may make." THE STATE EX REL KELLOGG v. CURRENS AND OTHERS, 111 Wis., p. 439.

V.

The findings of the referee are not conclusive on the court. They may be considered only to refresh the memory of the court as to matters of which the court will consider as common knowledge and of which it takes judicial notice, or for the purpose of bringing to the attention of the court scientific facts which would otherwise devolve upon the court undue labor.

If there is any reasonable basis upon which the legislation may constitutionally rest, the court must assume that the legislature had such fact in mind and passed the act pursuant thereto. The court cannot try the legislature and reverse its decision as to the facts. All facts necessary to sustain the act must be taken as conclusively found by the legislature, if any such facts may be reasonably conceived in the mind of the court. 6 R. C. L., sections 101 to 116, inclusive, and cases there cited.

The compounds manufactured and sold by the plaintiffs and other companies are in exact imitation of the genuine evaporated milk. They are produced and sold by the manufacturer cheaper than the genuine. They are not of equal food value as the genuine. They may be sold, however, and are susceptible of being sold to the public for the genuine at the same price. They are, therefore, capable of being used for fraudulent purposes and to deceive purchasers. The temptation of retail dealers is to sell the cheaper article in place of the more expensive article to increase their profits. If used as a substitute for milk, the public health may be impaired, not because the compounds are in themselves deleterious, but because they lack in certain food elements essential to a well balanced dietary. It was competent, therefore, for the legislature to find that the manufacture and sale of the compounds in question were conducive to fraud and deception, and likely to be injurious to the public health. Having so found, as we must conclude it did, it is not for this court to set its judgment against that of the legislature.

VI.

By reference to the federal census of 1920, we find that Wisconsin ranks first among all the states of the Union in total value of dairy products from its farms. It had 2,763,488 dairy cattle in that year, an average of more than ten to the farm. It held first rank in milk production, producing 858,258,521 gallons, valued at over 230 millions of dollars. It produced more cheese than any other state, the value of which amounted to $91,462,878. It ranked second in amount of butter produced. It ranked first in the manufacture of condensed milk. It ranked second in milk powders produced. In 1920, 64.9 per cent of the nation's cheese was produced in this state, and 26.6 per cent of her condensed milk, 24 per cent of her milk powders, and 11.4 per cent of the nation's butter were produced here. Nor is this all. The great dairy industry of this state is reflected in the high average production of agriculture crops of many varieties. The fertilizers from the dairy industry enrich the soil, so that of the north central states, Wisconsin was first in ten years average yield per acre in wheat and potatoes, second in barley and hay, and third in corn, oats and rye.

The reputation of Wisconsin for the purity and excellence of her dairy products stands high in the markets of the country, and the prices she obtains therefore are equally well sustained.

The constitution of our state was ordained, among other things, to promote the general welfare. Thus it might well be that the legislation in issue could be upheld to protect the reputation of the state for its dairy products in the markets of the country from adulteration and misleading representations. The advertisements of cocoanut oil compounds have been skillfully prepared to give the impression that the compounds are equal, if not better, than the genuine dairy product. For instance, a full-page advertisement in the Chicago Tribune contains a typical gem of the advertiser's art:

"Nutro is a delicious and nutritious new milk product. It is prepared in the rich dairying districts of Wisconsin and Indiana, and made of pure, fresh cow's milk with the animal fats extracted and essential food values replaced by a refined, rich, sweet, purely vegetable cocoanut fat.

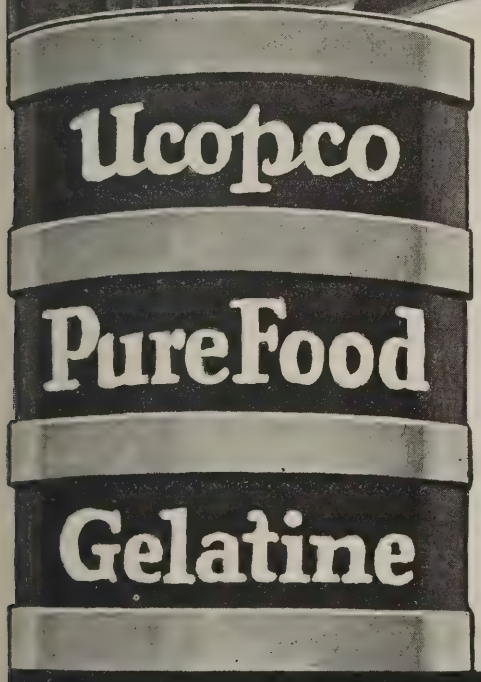
"Nutro is pure, delicious, wholesome. It is prepared in model condenseries from pure cow's milk evaporated to double strength, with the animal fats extracted and then enriched with sweet, edible, highly refined cocoanut fat."

Comment is unnecessary, other than to say that other advertisements are equally well calculated to convey the idea to the public that pure, fresh cow's milk from Wisconsin has been enriched and improved by the injection of sweet, edible, highly refined conoanut fat.

The state is not without power to protect its industries in its markets in this and other states, according to a decision of the Supreme Court of the United States upholding a statute of Florida designed to protect its fruit trade. We quote from SLIGH v. KIRKWOOD, 237 U. S., p. 61:

"We may take judicial notice of the fact that the raising of citrus fruits is one of the great industries of the state of Florida. It was competent for the legislature to find that it was essential for the success of that industry that its reputation be preserved in other states wherein such fruits find their most extensive market. The shipment of fruits so immature as to be unfit for consumption, and consequently injurious to the health of the purchaser, would not be otherwise than a serious injury to the local trade, and would certainly affect the successful conduct of such business within the state. The protection of the state's reputation in foreign markets, with the consequent beneficial effect upon a great home industry, may have been within the legislative intent, and it certainly could not be said that this legislation has no reasonable relation to the accomplishment of that purpose."

Nothing will destroy the reputation of the state in this industry more completely than to allow the manufacture of a cheap and inferior article to be advertised and sold in the markets of the world as and for the genuine article made in Wisconsin.



The principle of allowing these compounds to be manufactured and sold, followed to its logical conclusion, will lead from "filled" milk to "filled" butter,, from "filled"

butter to "filled" cheese, and finally we may have the "synthetic" cow taking the place of the domestic animal of the farm. Vegetable fats, cheap, but lacking in essential elements of vigorous life, will take the place of butterfats of demonstrable higher food value. A great industry of a great state will decline, a victim of "national advertising" of cheap and deceptive substitutes.

It follows that the act challenged by this action is constitutional and within the police power of the legislature.

By the Court.—The action is dismissed.

The issues of fact were exhaustively presented to the referee, Hon. A. G. Zimmerman, who made and presented to the court able and comprehensive findings of fact. His claim for services and disbursements are allowed.

Costs will be taxed against the plaintiffs as follows:

Services referee 20 days at $25 per day	$400
Services reporter, 12 days at $10 per day	120
Transcribing 4790 folios at 10c	479
Clerk's fees	...
	$...

No other costs to be taxed.

ANOTHER METHOD OF TESTING GELATINE.

We find the following method has been a good practical test of the jelly strength of gelatine. Color and odor are two things which can readily be distinguished by slight heating. For jelly strength we determine as follows:

We take one-half ounce sample of gelatine and place it on top of a pint of water. By placing on top we mean that we do not stir the gelatine in the water but place it on a piece of paper and hold the paper close to the glass of water and allow it to drop in very slowly and usually it remains on top of the water for some time. We know then the quickness with which the water dissolves the gelatine which is an indication of the solubility of the gelatine.

Allow it to stand for five minutes and then put the glass in a bath of water and gradually heat to 50 degrees. We then allow it to stand ten minutes and stir until thoroughly dissolved. We then take it out of the bath and cool for fifteen minutes in an ordinary room temperature and then place it in the hardening room for two hours. We then remove the sample in the hardening room and by gently pressing the finger to the top of the test we determine the resistance to the pressure given by the finger.

This resistance in a number of samples determines the relative strength and is very noticeable indeed, to the practiced finger with a number of samples.

In case that it is difficult to determine which of two samples is the stronger we find that by gently slipping the finger across the top of the sample in an endeavor to tear away the top surface, one can easily decide which is the stronger.

A very much more practiced test than the above is a comparative test for two gelatines in ten or more gallons of ice cream as follows:

Take some ice cream and put in a specially prepared square scoop about two inches square. It is understood that the ice cream for this comparison is to have been manufactured the same day and maintained at same temperature in same room for a certain time. Transfer quickly to a cool slab the sample or samples to be compared and mark samples number 1, 2, etc.

Into each square sample of ice cream transferred on slab stick a ruler graduated 1-32 inch and just note the length of time that it takes each sample to melt a given number of inches or fraction thereof. In other words, as sample one melts ¼ inch an hour and number two ½ inch an hour, the gelatine used in sample one is stronger than number two. M. F. F.

FARMVILLE CREAMERY BUYS ICE CREAM BUSINESS.

The recently incorporated Farmville Creamery, Inc., Farmville, Va., has bought the ice cream business of that place which was formerly operated in connection with the local ice plant by the Newman Ice Cream Company. The new firm has resurrected the old Farmville creamery and is making butter along with the ice cream. Mr. F. O. Jones, a practical dairyman of several years experience and a graduate of the Wisconsin Dairy School of the University of Wisconsin, is manager and treasurer of the firm. Mr. Jones is a man who keeps in touch with the improvements and conditions of the business through trade papers, and this, with his experience, assures the successful management of the business. The other officers of the organization are: A. F. Howard, president; N. B. Davidson, vice-president, and Geo. L. Stuart, secretary.

PHILADELPHIA MANUFACTURER CONSOLIDATES WITH LOCAL MILK DEALER.

The Breyer Ice Cream Company, one of the largest ice cream manufacturers in Philadelphia, has joined the P. E. Sharpless Company in forming the Breyer-Sharpless Milk Association. The Breyer Company confined itself to the manufacture of ice cream previous to the consolidation, while the Sharpless firm have long been known as manufacturers of fancy print butter and package cheese, as well as condensed and evaporated milk. Both of the firms had country plants which are now maintained by the Association.

The new organization is capitalized at $500,000 and will also engage in the fluid milk business in the city of Philadelphia. A 400 by 160 foot lot has been purchased upon which a plant capable of handling 60,000 quarts of fluid milk per day will be erected.

The officers of the new corporation were all officers of the original firms and are: H. W. Breyer, president; C. P. Sharpless, vice-president; W. S. Scott, secretary, and H. Nusbaum, treasurer.

MERCED, CAL., BUSINESS ENLARGING.

The Castle Ice Cream Company of Merced, Cal., owned and managed by C. H. Castle, Jr., recently purchased the building of the Fountain City Creamery. The Castle Ice Cream Company has been in business three years and the large and ever-increasing business has made it necessary that larger quarters be secured. The creamery building has been remodeled and an eight-ton refrigeration machine installed besides the 10-ton plant already in the building. Four 40-quart freezers will be operated and room for more equipment is there when the business needs it. The old plant has been put in use as a sales room and downtown office.

THE WEIBATCH LIQUID SCALE COMPANY, INC.

We are advised by Mr. J. S. Townsend, president and general manager of the Weibatch Liquid Scale Co., Inc., Grand Rapids, Michigan, that the above mentioned company has taken over the business of the Wm. G. Finch Company, manufacturers of the Weibatch and other liquid weighing devices. The amount of capital stock has been increased from $20,000 to $200,000. During the short time that the Weibatch has been on the market, splendid development has been made and plans are being laid for a greatly increased business.

All The Latest Improvements

In the 50 Quart Capacity U. S. Heavy Duty Freezer

The New 50 Quart U. S. Heavy Duty Freezer will be among those exhibited at the National Dairy Show at Minneapolis the first week of October. It has ***all the latest improvements,*** the same as all the larger sizes of U. S. Heavy Duty Freezers have.

We Can Supply You From Stock Without Delay

If, on account of a breakdown, or an overwhelming rush of business coming on late in the season, you must have another freezer ***right-away--quick,*** we can supply you ***promptly*** with a U. S. Heavy Duty Freezer ***from stock,*** embodying all the advanced improvements ***of the 1923 season.***

Our New 40 Quart for the Small Manufacturer

The New U. S. Heavy Duty 40 Quart Freezer is in a class by itself, and has been developed especially for the small manufacturer. It has been calculated to meet price competition without curtailing quality of material or workmanship, and is a high class machine that will efficiently meet all the demands of a small plant without fail. It is equipped with the Hinged Cylinder Cover peculiar to all our larger models.

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

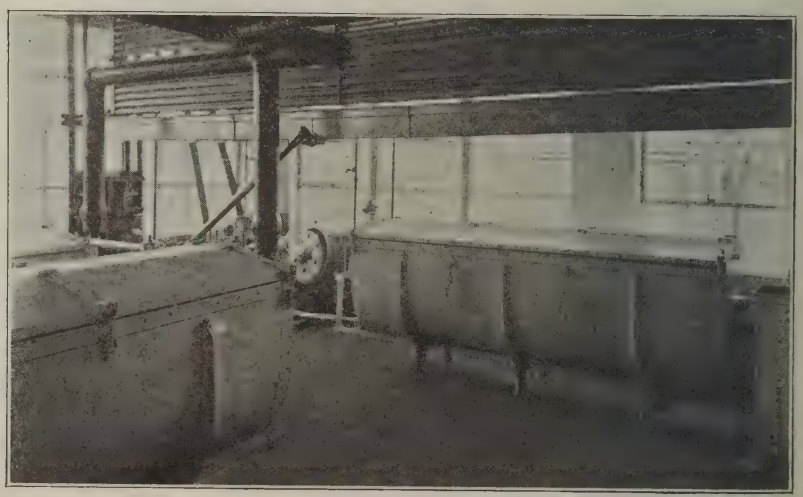
Millbrook Dairy Company Has First Class Ice Cream Plant

On February first, 1912, the Millbrook Dairy Company came into existence at Middleton, Connecticut, under the name of the Millbrook Farm Dairy. At first it met with indifferent success, but in February, 1915, Mr. Edward W. Hazen became president of the company, in which capacity he has continued ever since, and from that time on the company has made rapid advancement, until at present through its policy of dependability, high grade products and best possible service to all, it ranks among the finest plants of its kind in the East.

The Plant of the Millbrook Dairy Company.

One of the policies instituted by the new management was to pay farmers who sold milk to this plant on a basis of butterfat content, giving a premium for all milk testing more than 4 per cent butter-fat, and paying less than the base rate for milk testing below that standard. The quality thus established has been constantly maintained.

Business grew so rapidly that early in 1921 the quarters at that time occupied were outgrown, and plans were drawn for a new building, which was completed in March, 1922, and is now occupied by the plant.



Freezing Room, Showing Doors of Hardening Room at Left.

The Millbrook Dairy Company deals in milk, cream and ice cream. The purity and deliciousness of Millbrook ice cream, combined with the wholesomeness of this product, has created such a demand for it that dealers are willing to pay a slightly higher price for it in wholesale quantities in order to give their customers the perfect satisfaction resulting from its sale.

Millbrook ice cream is made from pure, rich cream of wholesome flavor, combined with other necessary ingredients, mixed in the proportions necessary to produce the finest results, and pasteurized to insure safety. It is manufactured with modern machinery, in light, well ventilated rooms. The accompanying pictures taken in the plant show part of the machinery, and indicate the absolutely sanitary conditions prevailing everywhere throughout the plant.

The mix is homogenized, and following this process is passed over tubular coolers, as shown in the photograph. After cooling it is passed into the aging vats, where it is held until it is frozen.

From the vats, the mix flows into the freezing room by gravity, where it is distributed to the freezers and frozen by the brine process. After freezing it is stored in the hardening room directly adjoining the freezing room. From the hardening rooms the ice cream passes to the packing room where it is packed in tubs for delivery. Salt and ice for packing are supplied by chutes from store rooms above, making the process rapid and convenient.

Room Where Homogenizing, Cooling and Aging of Mix Takes Place.

Officers of the company are Edward W. Hazen, president; Ashley A. Campbell, vice-president and general manager; John R. Lindmuth, treasurer and assistant manager; Charles A. Russell, secretary. The four officers and Robert Hubbard constitute the board of directors.

The management of this company are to be highly complimented upon the degree of perfection and efficiency they have achieved in the equipment and arrangement of this plant. It is a model plant in which no effort or expense is spared to turn out a quality product. The rapid and continued growth of the concern indicates that it pays in financial returns as well as in convenience and personal pride to operate a plant of this kind.

Send news items and personal notices to the "Review" and see how well they look in print.

Hydrox Company Uses Gigantic Spectacular Electric Sign

Following closely upon a number of other evidences of an aggressive merchandising plan, on June first The Hydrox Company of Chicago made a new and startling impression on the people of that city, including manufacturers and retailers of ice cream. This time the feature was the message "ENJOY HYDROX GUERNSEY ICE CREAM" blazoned forth by the largest and most spectacular electric sign west of New York.

The dimensions of the frame work are 50 x 70 feet. The five words of the advertisement contain 1,330 bulbs and can be read for two miles. The first word one can make out approaching from the South along Michigan Ave., is "JOY," which stands out all alone. But before a person has time to wonder what it is all about the second flash puts over the message, "JOY ICE CREAM." And then, after a moment's darkness comes the complete message, "ENJOY HYDROX GUERNSEY ICE CREAM."

This sign is at the wonderful new Boulevard Link Bridge, at the side of the celebrated Wrigley building, a location so strategic that the advertisement is said to be seen by several hundred thousands daily. In fact, no one driving into the city from the North or South side can fail to see the sign either on his way to or from the loop. And, considering that a pleasure drive through the boulevard system inevitably takes one over this bridge, it is safe to say that every one in the city who ever rides in an automobile will see this great sign.

The attention value of the sign has been so great that a full page in the Roto Gravure section of the Chicago Sunday Tribune, July 9th, was devoted to illustrating it. The spectacular greatness of the sign itself, plus the newspaper publicity it is receiving, cannot avoid adding new laurels to those already won by the Hydrox Company stamping it as one of the largest and most progressive ice cream companies in the country.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—St. Paul-Minneapolis, Oct. 7-14.

Pacific Association of Ice Cream Manufacturers

Proceedings of Annual Convention, Seattle, Wash.

(Continued from July issue)

Gentlemen, I take great pleasure in introducing to you Mr. W. C. Robb of the Puyallup Ice Cream Company of Puyallup. (Applause.)

Mr. Robb is possibly one of those best qualified to tell you about long-distance delivery and I would like to have everybody study that question.

In my report to you I dwelt on that question and I would be glad to have you give special attention to Mr. Robb who is one of your own ice cream makers and can tell his experience with long-distance hauling. And I would like to have Mr. Peacock, of Bakersfield, California, tell you his experiences along that line also.

ADDRESS OF MR. W. C. ROBB.

Mr. W. C. ROBB: When this question was given to me for discussion, I did not exactly know whether to consider it as a slam or an honor or personal courtesy, for the fact is that I am not long in experience in this long-delivery hauling and I do not feel that I am as well qualified to speak as perhaps some of you other gentlemen are.

I have been a member of this association for about a year, and in that year's time I do not believe that any one of us can get enough data together to warrant our stating authoritatively what the costs are.

The first of the month I was down in Oregon on account of the death of my father, and I did not realize the convention date was drawing so close at hand, and by virtue of having opened my mail I saw the program in front of me and was confronted with the fact that I had to get busy and prepare some sort of an address, and as I did not have time to offer any excuse I set about preparing something.

The problem of long-distance delivery by auto and its costs can be determined only by the many methods employed in the systems of accounting, employment of labor, kind of trucks used, conscientious scruples of the garage and accessory man, roads over which the delivery is to be made, and may I say, many other items too numerous to mention.

The idea of what constitutes a long haul, is made up of items that are as numerous as the opinions of probably as many as are interested in the subject, have formed.

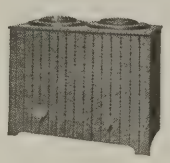
To stand up here and say that I have the correct system of accounting, when Mr. Terwilliger, without a doubt, stands ready to defy me, or that only the most efficient of labor stands ready at my beck and call, or that I have solved a plan whereby any and all garage and accessory men will lay aside their ambitions to achieve, in their eagerness to serve this particular plan, or to say that a Ford, Reo, Mack or White truck is the only one to use, facing the fact, that to speak unkindly of the service of any particular auto owned by an individual who prides his personal property, is equal to giving his dog a kick, are statements that my modest temperament will not allow me to make, even tho' I had solved the forementioned items to my own satisfaction.

However, it has been the expressed desire that I discuss this subject, and inasmuch as we are charged with the success of this convention, by each and every member putting forth his earnest endeavor in his particular assignment, I will make an effort to impart my opinion, rather than facts, hoping that the originator of the assignment will realize the ambiguity of the problem and turn to his own experiences, rather than to affirm any suggestions I may offer.

In the matter of cost accounting system for use in operating trucks, I belief I am safe in saying there is no system that has been universally adopted, owing to the fact that the task, in the minds of the majority, is greater than the advantage gained in the keeping of accurate accounts of cost records, however, several years ago automobile manufacturers got together and formed what is known as the Truck Owners Conference, Inc. They appropriated a large sum of money for the development of a standardized accounting system. High salaried men were employed, who gathered data and information from large fleet operators all over the country. From this information some forms have been adopted which are in use by a large number of operators and the complete set of rules are such that a clerk or stenographer can easily keep these records and which consists of: A daily service record to be kept by the driver giving the fundamental data.

A form for the monthly analysis and averages per day of operating data and cost.

A form for computing fixed monthly and yearly expense.



A form for computing the estimate and actual expense by months for one year.

And probably, the most important of all is the one which deals with the tire records. Operators are apt to be lax in their tire records of tires and tire mileage. Because of the fact tire expenses are scattered over a

Deferred Payments on C-T Electric Trucks *for the Ice Cream Manufacturer* who Budgets his Expenses

Are you one of those ice cream manufacturers who make up a yearly budget of expenditures? Fine. Do you postpone buying new equipment you ought to have because the large initial investment required will not fit into your budget? Sound business.

But if there were a way to get that equipment and leave your budget intact you would be satisfied all around, wouldn't you?

You *can* buy new and better delivery equipment immediately under the C-T deferred payment plan, requiring only a small initial investment that will not disturb your budget. The balance is spread over a number of months and is practically absorbed by the additional earnings from using C-T Electric Trucks.

C-T Deferred Payments are Fair, Complete, Business-like. They Fit your Budget

Deferred payments on C-T delivery equipment are not offered as a favor. They are a business-like proposition—one of our regular standard terms of payment.

There is *no insurance required by us, no carrying charge* for 12 months, only a reasonable charge if extended to 18 months or 24 months.

Moreover, they cover chassis, battery, standard body—full equipment, and apply to all capacities of C-T Trucks.

This is the opportunity you have waited for to get new, quality delivery equipment immediately. Write now for full particulars.

All Capacities from Bantam to 5-ton

Commercial Truck Company *Philadelphia*

C-T STREET TRUCKS

"PROSPERITY PROVES THE FORTUNATE, ADVERSITY THE GREAT."—PLINY.

period of the life of the truck and do not come in a bunch there are very few men that realize that the tire expense in all amounts to more than the purchased price of the truck. These forms I myself have not put to practice but I feel that they are worthy of the effort and I mean to adopt and put them to use on the first of the year. They can be obtained by application to the company at 327 So. LaSalle St., Chicago, Ill.

The employment of labor is a vital factor in the cost of a long distance delivery, and care should be exercised in the selection of a truck driver. Not only should he be mechanically inclined, but he should have the faculty of mixing well with the trade, have pride in his personal appearance and should school himself in the art of salesmanship, and above all, be a careful driver. All these points if perfected will go a long way towards reducing the cost of delivery, as it will create the maximum volume of business on any particular route in mind.

In the system of selecting a crew of drivers, conforming to these requirements, it can only be done by the sound judgment of the manager in charge, but I have my faith in my own particular plan of cutting down the accident costs and that is: Insure all autos with liability and property damage, protecting yourself in this manner towards the injury of the other party and then if it is your driver's fault, it is up to him to stand good the damage done your property. Of course you cannot compel him to do this but if he values his job to the amount of the damage, he can have the option of standing for the damage or losing his job. It is well then that he has some financial interest at stake upon his departure from the plant.

That the conscientious scruples of the garage and accessory men, together with the condition of the roads over which the delivery is to be made, is in no way a statement that is intended to reflect discredit upon these men or the honorable body of County Commissioners, but bears out the fact that this particular subject is a problematical one and resolves itself into the fact that the longer the delivery, the greater the expense and this brings it back to the accounting system, which in itself will suggest that the greater part this item has to play in the game the greater will be the uncertainty as to the desired results and thus too much shouldered off on to this particular system should the balance show up in the wrong side of the ledger. Yet in order to promote the ice cream industry our country customer must be taken care of, but why not let the man with the nearest supply take care of them and devote more-time towards increasing our local business? Too long deliveries over too bad roads, with small volume does not pay, in my opinion. (Applause).

* * *

Mr. Dunne: Are there any questions?

Mr. Swanberg: Have you any knowledge when it would be cheaper by express to the customer than by your own conveyance?

Mr. Robb: As I have stated before I haven't any direct data, only as I have only been in the business a year in this particular locality, and to give my opinion it is not a matter of expense, it is a matter of service.

Now, it is in the minds of some that the country customer is not entitled to the service and the price owing to the fact that his overhead expense is nothing in comparison with the high rent of the city man, but when we consider the fact that a country customer dispenses his cream mostly in the form of quarts and pints, I think you are oftener with a shrinkage in that respect and I think some consideration is due the country customer and I do not think—of course the matter of expense is a vital factor, yet at the same time you can create your volume to make the delivery it is my opinion it is as cheap to deliver by auto as it is by express.

Mr. Swanberg: For a small amount it would be cheaper to do it by express, would it not?

Mr. Robb: It would be cheaper by express.

Mr. Swanberg: That is what I thought. I am just starting over again. I was in the business years ago but I am just starting in again, and there has been much progress since then.

A Member: Do you think there is any saving by using horses on a short, compact route, instead of using autos?

Mr. Robb: That reverts back to the item of service. You cannot give as good service as you give with autos if you use horses. The horse seems to have taken a back seat in favor of the auto.

The Member: Within easy distance of the factory the auto expense runs pretty high. I was wondering if there was any saving to be had by keeping a team.

Mr. Robb: I am not familiar with the cost of keeping a team and I have no exact information due to the fact that my records are not complete.

I have been conducting my business like I presume the majority of you men have and I have been lax in my methods of cost accounting. I do not know whether that statement will bear out or not but I believe in talking with different automobile men that comparatively few fleet operators know exactly how they stand on their automobile cost. If there is anyone here who has it in plain figures I would like to see them.

Mr. Dunne: Horses eat a lot of the time when they are not doing any good. I think our cost with horses

544 Washington Blvd., Chicago, Ill.

Ask the Man Who Uses It.

Dependable Uniformity

"We have used your Vanilla Flavor for so long a time and will continue to use it as long as you maintain your high standard of quality. Our ice cream maker won't let us even try out any other brand simply because he knows your next shipment of vanilla extract will be identical in quality as the last. He says he can't see the use of experimenting with other brands when year after year your flavor has never failed us—always the same good quality, always dependably uniform."

The above explains why we succeed so well in holding our trade. Naturally, such confidence brings with it a responsibility—that of maintaining a high standard of quality at all times and at a reasonable price. We regard this confidence and prestige too highly to ever jeopardize it under any circumstances.

What is true of our Vanilla Flavor also holds good with our minor flavors and our colors. We sell them for what they are, knowing that they will give entire satisfaction. What's more, we guarantee satisfaction.

De Coursey Creamery Company Occupies New Plant

An event that comes as the triumph of years of steady business growth is the occupation of their newly enlarged plant by the De Coursey Creamery Company, of Kansas City, Kansas. At an improvement cost of more than $100,000, this company has erected a new main plant, which more than triples its former capacity, and increases its floor space to approximately 34,000 square feet. This makes it the largest plant in the state devoted to the manufacture of ice cream and butter, and one of the largest in the middle west.

The possible capacity of the new plant is 1,000,000 gallons of ice cream and 6,000,000 pounds of butter annually. The company also has branches at Wichita and Leavenworth, both of which show gratifying increases in sales each month.

Those active in the management of the De Coursey Creamery Company are J. H. De Coursey, F. C. De Coursey and W. B. De Coursey.

The De Coursey name has carried prestige in the dairy industry for a great many years. The present business success has its roots in the days before the Civil War, when the Leavenworth Creamery was owned by Harry De Coursey.

In 1906, at Kansas City, Kansas, in a twenty-five foot storeroom the De Coursey Brothers started in the dairy and creamery business, necessarily in a small way. Today, in the 16th year of the company's existence in Kansas City, it is in the foremost ranks in the west.

The De Coursey specialties are "White Rose" butter and "Perfection" ice cream. The quality of these two products has created a demand for them that has increased the annual sales of this firm from $16,500 in 1906, to $1,409,630.56 in 1921, an increase of over 8,500 per cent. In addition to supplying these products to Greater Kansas City, the distribution throughout the state of Kansas is large, and they are shipped into four neighboring states—Missouri, Nebraska, Oklahoma and Iowa.

The De Coursey Brothers are firm believers in the value of advertising in introducing their products into a new territory. They also firmly believe that the demand thus created can only be maintained and increased by reliable quality and efficient service.

This new plant is a monument to sound business principles and intelligent, untiring enterprise.

The Important Ingredient is GELATINE

"B" Brand Snow White Gelatine Guaranteed 2 Oz. Goods.

Genuine imported gelatine, Snow white, is tasteless, odorless, colorless, and practically free from bacteria; and complies with all Pure Food Laws. Absolutely uniform; no variation; goes twice as far as ordinary grades of gelatine. Ice cream manufacturers should consider these qualities when ordering gelatine. Only requires about 2 oz. to a batch. Sample on request.

WE WONDER!!!

Small boys often ask embarrassing questions. A preacher was addressing the Sunday School and explaining the significance of white. "Why," he asked, "does a bride desire to be clothed in white at her marriage?" As no one answered, he went on: "Because white stands for joy, and the wedding day is the most joyous occasion in a woman's life."

Immediately a little fellow piped up. "Please, sir, why do the men all wear black?"—Trumpeter.

PACIFIC ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from page 36)

was about three times as high as it has been with trucks. I have not had a horse for five years.

Mr. Swanberg: I think as far as short hauls are concerned right in the center of the City of San Francisco, I think we get along as quick with horses as we do with automobiles. We have to stop at every corner and wait for the policeman to let us by and I am seriously thinking of not using my automobile any more for my own purpose. There seems to be too many automobiles in the center of San Francisco to get along, altogether. (Laughter).

Yes, there really does.

Mr. Dreyer: It might be well to explain our situation in Visalia. Visalia is on a side line of the Southern Pacific and we have not very good express service and we have established two routes of delivery, one is going from Visalia to Porterville and back over the main highway to Larry and then to Visalia again and that route is about one hundred miles and the other route covers a travel of about eighty miles, and we make two trips daily.

We have found it to be very profitable, in fact, more so than I ever dreamed of, for the reason in the summer we can double deck it and we have a trailer which we do not load at all. It is being used to haul in the empties, and we have to pay eighteen cents for every retainer emptied, fifteen cents rather, we were making that much of a saving on the trailer and we find it profitable in our instance because we are not on the main road.

Mr. Dunne: Is there anybody else? Mr. Peacock, have you anything to say?

Mr. Peacock We used to use horses and we have horses on our ranches, but we operate trucks for our hauling. We operated two small trucks in a small town of twenty thousand people for the last two years and we feel more satisfied with them than we were with horses.

Mr. Dunne: Will you tell about that new refrigerating body that you have?

Mr. Peacock: I could not say it is new. Somebody in Sacramento told us about it. It is just a common body with a little tank in the top of the compartment where the ice cream goes. You have a side door and you put the ice cream in that compartment. We like it very much. You do not have to put the ice cream in among the cracked ice and you can take it out in the dry chamber.

Mr. Dunne: Does water run around the sides?

Mr. Peacock: The water has a drain, and we drain the brine out of the can whenever the ice melts.

Mr. Swanberg: Where is that?

Mr. Dunne: At Bakersfield. How long will one packing last?

Mr. Peacock: It lasts a trip, or say four or five hours, or six hours; they generally come back at noon, and they will re-ice and salt that tank and it goes into the afternoon.

Mr. Swanberg: Can you put in more cans in that way?

Mr. Peacock: No, I do not think so. You set them in a chamber like a cabinet. There is no ice around the can. The ice and salt are in the tank above and the cold comes down.

Mr. Swanberg: But when you are delivering to a customer you put in the ice?

Mr. Peacock: We have another compartment for the ice.

A Member: What size truck is that?

(Continued on next page)

The DAIGGER CORPORATION

(Mfrs. of Washburn's Ice Cream Improver)

CHICAGO U. S. A.

Mr. Peacock: It is a one ton Ford. It is overloaded, the whole outfit weighs about 3200 pounds when it is loaded. It is overloaded but it went all through the summer.

Mr. Gregory: That cabinet you store the cream in is all in one box?

Mr. Peacock: Yes, Sir.

Mr. Gregory: One door?

Mr. Peacock: Yes, one door, on one side only.

A Member: You handle all kinds of flavors? Do you not have to throw out some of them to get at the flavors you want?

Mr. Peacock: No, sir; they are lined up in some way that we can get at them.

The Member: You are carrying about one hundred gallons?

Mr. Peacock: Yes, sir.

The Member: You have to double-deck to handle one hundred gallons, do you not?

Mr. Peacock: No.

The Member: About how much ice does it take to take care of that?

Mr. Peacock:. About a block of ice with the salt. There is generally some in there left from the day before. We drain the water out and put in a fresh block of ice. If anybody wants me to do so I can give you the dimensions of it so that you can work it out.

Mr. Dunne: If you will drop Mr. Peacock a line he will give you definite figures. He is with the Kern County Creamery at Bakersfield, California.

We will hear about "California's Fight Against Selling Ice Cream by Weight." The charts will be put on the wall tomorrow. The paper will be read now.

There are two drug stores in Los Angeles now selling ice cream by weight and there has been serious objection on the part of certain officials in California to sell ice cream any other way, and I am sure we will have trouble with that situation later. Mr. Dryden was formerly Professor of Bacteriology in the University of Oregon and he comes well qualified to speak to you on this subject and there is no one better qualified than Mr. Dryden to make the fight against this proposition.

Mr. Dorman, one of the Vice-Presidents of this organization, from Los Angeles, California, will read this paper.

Mr. Dorman: I am very glad to be here at the meeting of this Association today. I think it is an honor to have people from California invited here. We are glad to come here and get information, and to dispense information to you if we are able to do so.

This coming into this arid or semi-arid climate of yours—I have almost lost my voice, and as we are to have that stag party tonight I am glad that my turn has come tonight instead of tomorrow, because I am afraid tomorrow I will have no voice at all. (Laughter) Mr. Dryden is always ready to devote his service and money for such an examination as is shown here. I will now read Mr. Dryden's paper.

* * *

ADDRESS OF ROBERT J. DRYDEN.

History and Program.

On December 18, 1918, Mr. Charles G. Johnson, State Superintendent of Weight and Measures, addressed a letter to our Association suggesting that his office was interested in establishing a weight standard for ice cream. Prompted by this letter our Association appointed a committee to work throughout the year gathering data and ascertaining various things having to do with ice cream standards.

The instructions given this committee were broad and unrestricted. It was the attitude of our Association to thoroughly analyze the weight question, and if possible, to meet any constructive and progressive plan which would be of interest to the legitimate manufacturer and the public.

It was found by this committee that nowhere in the United States had the weight standard for ice cream been suggested officially by a State Department or any official body having to do with the control of food standards.

The Dairy Division of the U. S. Department of Agriculture reported that the matter had never been discussed by them and that they were not authority for a statement regarding same.

Without any available source from which to obtain information on this subject, our Committee set out to obtain information which would answer if possible the following questions:

1. Would a minimum standard of weight per gallon be a basis for control?

2. Would a standard of total solids be practical, and would this tend to stabilize weight?

3. Has weight in Ice Cream a close correlation with food value?

4. Should ice cream be sold by weight, eliminating the liquid measure?

Dr. C. L. Roadhouse offered the service of the Dairy Division of the University of California to gather data for our investigation. Professor Turnbow and his assistants carried out the detail investigations in several of the commercial plants in the state.

1. Would a minimum standard of weight per gallon be a basis for control? It has been suggested that a

"MASTER METAL"

WRAPPERS

THE FOIL WRAPPER—WHAT IS IT?

The glowing sparkle of Master Metal radiates light and causes color-printing to stand out with remarkable brilliancy.

The Master Metal Carton is our latest creation and a big sales-winner.

Attractive prices.

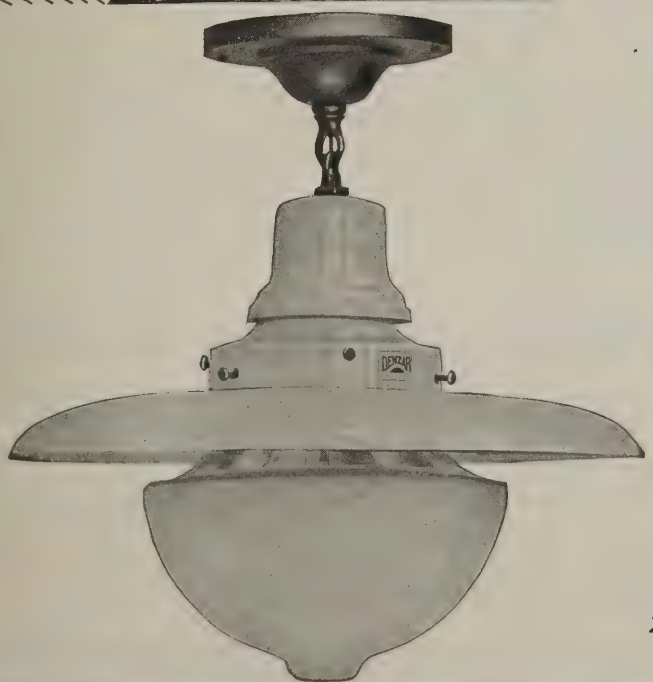
It is the outward sign of the quality put into Eskimo Pie, Ice Cream Bricks, or Chocolate Coated Bars.

It is the foil wrapper which the consumer sees —which tempts him and "tickles his taste" into buying.

It is a great deal more than a thin sheet of metal used for wrapping Ice Cream Bars.

Don't Take Any Chances With Your Wrappers

Some Wrappers may cost less than Master Metal but you pay far more in the end — in loss of sales, in injured prestige. Master Metal Wrappers advertise quality and help build good will.



UNITED STATES FOIL COMPANY

LOUISVILLE - KENTUCKY

DENZAR

THE UNIT OF DAY BRIGHTNESS

A fitting title for Denzar because Denzar floods the room with a soft, white radiance which resembles daylight. Ice cream manufacturers will find in Denzar the ideal light for their offices and mixing, freezing and packing rooms, because the white opal glass and white enameled holder add to that spotless plant appearance so vital to the successful manufacturer. The absence of glare and harsh shadows in the Denzar lighted room is also important because it permits the workers to perform their tasks with the same ease as when working under daylight conditions. Let us tell you more about Denzar and why it is preferred by thousands of merchants and employees who appreciate the value of adequate glareless lighting. An interesting catalog which covers the subject in plain language will be sent you on request.

Beardslee Chandelier Mfg. Co.

4.30 4.30 4.92 5.00 4.80 5.00 4.70 5.10 4.70 5.00 4.50
4.50 4.40 4.60 4.50 4.71 4.71 4.70 5.00 5.00 4.89

Average weight per gallon..... 4.663%
Maximum per cent variation above.....28.67 %
Maximum per cent variation below..... 7.78 %
Extreme per cent variation.....36.45 %

1. It is to be noted that there is a wide variation in the weight of ice cream from the same mix. This is decisively illustrated in the above tabulations. Closer examination reveals the fact that the variation was not attributed to any one particular style of freezer, temperature of brine, flavor of ice cream frozen, or any other noticeable condition. In fact the freezing was carried on as carefully as possible and for this reason these figures are valuable because they show the true problem which confronts the commercial plant.

2. Would a standard of total solids be practical, and would this tend to stabilize weight? It has been suggested that the total solid standard might be adopted, presuming that the higher the percentage of solids, the more uniform would be the weight per gallon. However, we refer again to the commercial factories in the following chart. Here it is shown conclusively, that there is no particular correlation between the percentage of total solids, and the variation in the weight of ice cream. One might even draw the conclusion that the higher the percentage of solids, the larger was the variation:

Factory A. 51.30% Extreme Variation 33.81% Solids
Factory B. 98.00% Extreme Variation 36.05% Solids
Factory C. 39.00% Extreme Variation 36.05% Solids

It would be entirely practical to establish a standard of total solids per gallon, but from the conclusions drawn from the above table, it seems of no particular advantage so far as regulating the uniform weight of ice cream is concerned.

3. Has weight in ice cream a close correlation with food value? The weight of ice cream has only a certain relation to the relative food value. To illustrate this, I will state that ice cream made from a mix containing 32% total solids weighing 4½ pounds per gallon might have less food value than a cream containing 36% total solids and weighing 4 pounds per gallon; you can see from this conclusion that if it were possible to establish a uniform weight per gallon of ice cream that it would be of little value unless the percentage of total solids was taken into account; if it were possible to establish methods so as to uniformly manufacture ice cream out of the same mix to contain the same weight of total solids, I would then suggest a standard based on pounds of food solids per gallon.

4. Should ice cream be sold by weight, eliminating the liquid measure? For us to properly answer this question, we must of necessity consider the following factors:

1. Manufacture and distribution wholesale.
2. Retail purveyor and buying public.

1. Manufacture and distribution wholesale. For the wholesale ice cream manufacture to put up ice cream in containers to sell by weight would require the complete revolution of present manufacturing methods and

equipment. Under these conditions, it would require the tare weight be marked on each container, the cream would then have to be weighed as it is drawn from the freezer. Ice cream, being a frozen product, requires that it be handled with all expediency possible to preserve its quality. After being drawn from the freezer, the weighing and tagging necessary under these methods would therefore be a serious handicap.

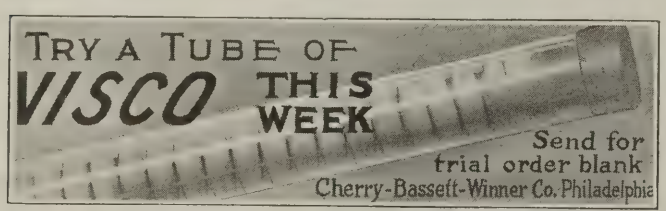
2. Retail purveyor and the buying public. Providing ice cream were sold to the retailer by weight we find various seriously objectionable problems to meet. From his standpoint ice cream, as we all know melts readily and if it were necessary to weigh and handle it, we are sure that the practice would be very distasteful and certainly would be a serious handicap toward pleasing the public. In the case of brick ice cream the problem would be to weigh separately each brick and if we should find a 90% variation or less, as was previously illustrated in this paper, it can readily be seen, that the retailer would have a hard problem convincing the purchaser why he should pay as much for one pint today as he did for one pint and one half yesterday.

In treating this problem we might add that the retail seller of ice cream absorbs the shrinkage in handling between the wholesaler and the public. If ice cream weighs 4½ pounds to a gallon, when it is dipped either for cones, dishes or to be packed in paper buckets it will weigh on the average of 15% to 20% more in equal liquid displacement when sold to the consumer.

These are facts which we manufacturers realize. The retailer also appreciates this fact and naturally regulates the margin between wholesale and retail in order to cover up this discrepancy. The public, on the other hand, actually gets more food value in a quart container of dipped ice cream than in a quart brick. Our observation is that the public is gradually buying more brick ice cream not because they do not appreciate the fact that they would get more food value in a container of "dipped" cream but because they feel more secure in trusting the manufacture to measure the ice cream as is done in the form of bricks.

Conclusions: It is my idea to carry these investigations out at considerably greater length and to try if possible to show the cause for these extreme variations in the weight of ice cream out of the same mix. I might state that in two of the plants that furnished the data for this paper that the Mojonnier scale was used and the cream was drawn at a definitely reported over-run; incidentally Factory C had by far the least variation, and did not use a Mojonnier scale; this is not an argument for or against over-run, but it is proved that the value of these scales is considerably over-estimated by their manufacturers.

The following table shows the recapitulation of the information above reported:



Factory	Flavor	Lowest weight per gal.	Weight of Solids	Highest wt per gal.	wt solids per gal	variation	total solid
A	Vanilla	4.00	1.352	6.052	2.066	51.3 %	3.80
B	Vanilla	3.03	1.092	6.00	2.163	98.00%	36.05
B	Strawberry	3.379	1.218	4.948	1.787	46.7 %	
B	Chocolate	4.479	1.615	5.20	1.875	16.09%	
C	Vanilla	4.30	1.419	6.0	1.981	39.53%	33.01
C	Strawberry	4.40	1.459	4.71	1.555	7.05%	
C	Chocolate	4.80	1.584	5.11	1.687	6.46%	

In concluding this paper, I do so mindful of the attention which has recently been centered on the weight of ice cream, and I wish to say that any state legislative committee considering legislation based on the weight of a gallon of ice cream should be given these facts, and while, as was the case in California and Ohio where these figures were used, there was no reason or basis upon which legislation for the control of ice cream could be constructed. In California we laid the cards on the table, so to speak, and the larger we could make our advisory committee composed of State Pure Food Officials, the more complete was our victory.

I am so completely absorbed in the results of this paper that while I find it impossible to deliver this paper in person, I will volunteer to give my time and expense to go to Washington or Oregon and help present this information, at a time when legislation is being fought.

My experience with authorities and persons interested in food control and standards prompts me to say that legislation is suggested by them most times without a clear understanding just what they are doing; it is therefore our duty to know and understand our own industry and when these things do come up, we should oppose them constructively by education among these officials.

Mr. Dunne: Those charts set out some astounding

facts. I would like to have you hear Bill Dreyer tell how he decorated that big cake of ice cream and we will have him do so before we get through. There will be a meeting of creamery men immediately upon the adjourning of this meeting.

I am requested to read to you an announcement sent out by the Pacific Slope Dairy Products Show which is to be held at Stockton, California, December 6 to 11, 1921, where there will be held five big conventions: The California Creamery Operators' Association, California Butter, Cheese and Ice Cream Makers' Association, California and Southwestern States Ice Cream Manufacturers' Association, State Milk Distributors' Association, and California Dairy Council.

Mr. Dorman: We are bound and determined that President Dunne and Secretary Walker shall come to our Dairy Council.

I was particularly interested in the report of the secretary of the dairy council of Oregon. We have two working in California. These meetings are principally in charge of Mr. Greene of California who is a wonderful man.

Stockton is a little ways down from San Francisco between Los Angeles and San Francisco. If you have not heard of Los Angeles, it is a little suburb of San Francisco, about five hundred miles to the south, and we would like to have you come down there.

Mr. Dunne: I want to assure you in advance that those fellows will show us a good time if we are able to attend that meeting. We have met a lot of the boys already and they will make it a royal good time for us if we are able to go.

I wanted to say that I am going to ask the Resolutions Committee to draw up and present to the ladies a vote of thanks of this organization for the entertainment they have provided our lady visitors and I should like to have you do that.

Mr. Swanberg: I make that as a motion.

(Whereupon said motion was duly seconded and was put to the convention by the president and carried unanimously and so ordered).

Mr. Dunne: The committee reports are not in and we will adjourn until tomorrow morning. I want to say something about the meeting tonight. The ladies will assemble in the lobby of the hotel and will go to a theatre party at the Moore Theatre.

There will be a round table talk by the ice cream men. We want you to all be here. You can bring up your problems, the problems of your own plant, your mixing problems or your machinery problems, and this is for the active members of the association and we want you all to be here.

And at nine o'clock we will leave here in motor cars going to the Motor Dealers' Club. That will be a real "stag." By the description that has been given of it, it will be really ferocious. "The biggest night ever featured at an ice cream men's meeting will be staged. Alaska, Port Said, the Days of '49, Nevada in its Prime—you may have seen all of these, but this evening will find something new. A real night for real men—that means the ice cream crowd. You can't afford to miss this." If it beats Port Said, believe me it will be a bird. Now, that is going to show us a good time and the ladies will be entertained while we are entertaining ourselves and I think we can leave it to the Seattle boys to give us a good time.

I would like to have the Resolutions Committee draw up a vote of thanks for this entertainment, but we will wait until the night is over so we can describe it suitably.

I want to call attention to the fact that there is an exhibit in the back room and there is one machine downstairs. There are several machines here and I would like to have you see those things, and I believe we will have another exhibit in the morning. There will be another demonstration at the plant of the Seattle Ice Cream Company and there will be a demonstration of the packing machine at the same time.

I was rather startled to see the things that those machines will do. The Mojonnier people were notified that their machine was wrecked by the railroad company and they cannot demonstrate it.

Mr. Groves of the Washington Chocolate Company is now a member of this association and advises us that the Washington Chocolate Company is keeping open house this week and anybody who wants to see the chocolate factory in operation, this is the opportunity to do so. They will be glad to welcome you and show you all through the plant.

Bill Dreyer is so well known as the canary of Visalia, Stockton and Fresno and San Francisco, that it is needless to introduce Bill to you. (Applause.)

(To be continued in following numbers)

He who knows not and knows not
that he knows not, he's a fool
Shun him
He who knows not and knows
that he knows not, he is simple
Teach him
He who knows but knows not
that he knows, he's asleep
Awake him
But he who knows and knows
that he knows, he is wise
Follow him

Elyria quality is like a sectional bookcase—complete at every stage, but constantly being added to as new requirements arise. A pioneer in the field of Glass Enameled Equipment, Elyria has developed and ***is developing*** *the features of design and construction which set manufacturing standards. To* ***Serve****—not to* ***Swerve****—to* ***Lead****—not to* ***Follow*** *is an ideal—not just an idea.*

The illustration shows three 1600 gallon capacity Elyria Glass Enameled Steel Storage Tanks in the plant of the Kemps Ice Cream Company, Minneapolis, Minn. Front and rear view.

"Have conserved cold storage space and have saved considerable labor in handling"

FOUR thousand eight hundred gallons of cream are held in the Kemps Ice Cream Company plant where only fifteen hundred gallons were held before!—this is the increase in capacity effected by installing Elyria Glass Enameled Steel Storage Tanks in place of copper tinned vats.

Elyria equipment is designed, built and installed to work *with* your plant processes — not *against* them; to save floor space and head room; to reduce time and labor; to *increase* output and *lower* costs; to insure steady, uniform production by smooth, constant operation, without hitch or falter.

Free Booklet Tells "How and Why"

Spend a HALF HOUR reading this booklet and learn the developments in Glass Enameled Steel Equipment that have taken YEARS to make perfect. It explains why Elyria Enamel, tank design and construction, plus Elyria service make Elyria Tanks the best investment in Glass Enameled Equipment. Mail the coupon.

How to Standardize the Ice Cream Mix

By R. M. WASHBURN, Director of Laboratories, International Dry Milk Company, Minneapolis, Minn.
(As Prepared for Minnesota Ice Cream School, Dec. 1920.)

FORMULAS for the making of ice cream have a place in the working factory, but a knowledge of how to standardize the mix by introducing the various ingredients in the right quantities to bring about the desired percentage amounts of fat, sugar and total solids is of greater value than the possession of even many formulas.

State laws and city ordinances require a minimum of various amounts of fat, but commercial competition requires in addition a minimum of sweetness, total solids, pleasing physical condition and taste.

In making up the mix it is most convenient to do so by "batches," using full cans of cream, milk, and condensed milk to simplify weighing. Larger or smaller batches may then be easily made by doubling, quadrupling or halving the unit batch, etc.

If then we work to, say the Minnesota standard of 12 per cent fat, we have as our requirements that the mix shall analyze about 12.25 per cent fat, 12.5 per cent to 14.5 per cent sugar, 8 per cent to 10 per cent milk-solids-not-fat and 34 to 35 per cent total solids.

Composition of Ingredients.

Before we can calculate the composition of the mix, however, we must know or have at hand a table showing the nature and composition of each of the several ingredients to be used, and desirably, too, a knowledge of how and why the components vary.

Cream. The more fat any cream contains, the less of other solids it can have; the fat crowds out the non-fatty solids. Therefore, to be able to compute the total solids content of an ice cream accurately, a table showing the composition of milk and cream of various grades is necessary. Such a table is shown, herewith, and also a statement of the weights per gallon of the same.

Evaporated-Condensed Milk. By condensed milk is usually meant sweetened condensed milk. This grade is little used in ice cream, and therefore will not be considered further here. By evaporated milk is meant milk from which more than half of the water has been driven off, leaving a creamy milk containing about 2.2 times the original total solids content of the milk. If a natural milk contain, say 87.8 per cent water and 12.2 per cent total solids and is reduced 2.2 to 1, the finished evaporated milk will contain (12.2×2.2=26.84) 26.84 per cent total solids, and if such milk tested 3.25 per cent fat in its natural condition, the evaporated milk would test 2.2 times as much, or 7.15 per cent fat. In the handling of milk and cream, however, there is always a loss and the loss of fat is greater in percentage amount than of any other constituent. Consequently a plain evaporated milk often tests as low as 7 per cent — such evaporated milk weighs about 8.85 pounds per gallon.

Skim Condensed. The greater part of the condensed milk used in ice cream making, however, is skim milk reduced about 3, 4, or 5 to 1. An average skim milk carries about 6.9 per cent solids; therefore, if reduced 3 to 1, the condensed milk would carry (3×8.9=26.7) 26.7 per cent total solids, or if reduced 5 to 1, the condensed milk would carry 44.5 per cent total solids. The degree of condensation varies as between different plants and in the same plant at different times unless very carefully guarded against, therefore in the calculation of the total solids content of ice cream, one may miss the true figure widely unless one knows what the particular condensed milk used does analyze. The buyer of condensed skim milk for ice cream making would be warranted in requiring a guarantee from the manufacturer as to its total solids standard for in no other way can he standardize his own work.

Skimmilk Powder is much used in ice cream manufacture in conjunction with rich cream or butter, for the building of body. It seems perfectly dry to the hand, yet it contains about 2 per cent moisture at its driest and will absorb from a moist room until it contains 6 to 8 per cent. It will not keep well, however, at this high moisture figure. In general we may assume an average of 3 per cent moisture; therefore, a 97 per cent total solids content.

Whole Milk Powder. Until quite recently there was no way known of producing a powdered whole-milk in which the fat would remain sweet and non-rancid long enough to warrant its manufacture, but fortunately such is no longer the case, and wholemilk powder may be used where conditions of availability and price will warrant. When standardized to be reconstituted to produce a 3.25 per cent fat milk the powder will analyze 26 per cent fat, about 2 per cent moisture and 72 per cent non-fatty solids.

Butter. Sweet butter, i. e., that containing no salt, is much used in building up the fat content of an ice cream mix. When made for general market it must

not contain to exceed 16 per cent moisture, therefore contains about 83 per cent fat. Ordinary market butter may be used, however, with satisfaction by simply melting it at a temperature of about 115° F., allowing the salt, curd and water to settle out, and using the clear butter oil. In doing this the oil will, of course, be figured as 100 per cent fat. This practice also saves analyzing the butter.

Granulated Sugar (cane or beet sugar). Common dry flour contains more than 12 per cent moisture, oatmeal 8 per cent, but sugar, even if stored in a damp cellar, will absorb only ¼ per cent moisture, or less. As a general working formula we may consider that common sugar contains 100 per cent solid matter, all soluble and all digestible.

Inverted Sugar Syrup is made by treating sugar to tartaric acid in the presence of water. In the proportions 100 lbs. sugar, 44 lbs. water and 4 oz. tartaric acid dissolved and boiled for 25 to 30 minutes produces about 140 lbs. of clear syrup, said to have the sweetening power of about 125 lbs. of normal sugar. When boiled to produce 140 lbs. of honey-like syrup it will have 71.5 per cent sugar.

Corn Sugar is about 10 per cent moisture, therefore about 90 per cent solids. It is only about 60 per cent as sweet as cane sugar. It costs less per pound, however, and may be used to piece out other sugar, but not to take its place entirely because of its pungent taste.

Corn Syrup is a clear, mildly sweet syrup, containing about 82 per cent solids and possessing about 60 per cent the sweetening power of common sugar.

Gelatine is used in small amount, about one-half of 1 per cent or less. It absorbs moisture very readily, in fact is known in chemistry as an "imbiber." It contains about 5 to 10 per cent moisture and 90 to 95 per cent solids.

Gelatine Water. Some ice cream manufacturers dissolve the gelatine in as much as 6 parts of water to 1 of gelatine, while others start the gelatine in water, then expand it in some of the milk which is to be used any way for the reduction of the heavy cream, and yet others use milk entirely, but whatever amount is used must be considered in calculating the percent solids in the final mix.

As an aid in preparing a mix, the following table will be found valuable as giving approximately accurate figures:

AVERAGE COMPOSITION AND WEIGHT PER GALLON.

	Per Cent Fat	Per Cent Milk S. N. F.	Per Cent Sugar	Total Solids	Specific Gravity	Weight per Gal., lbs.—
Water	0.00	0.00	0.00	0.00	1.000	8.3216
Milk	0.02	8.91	0.00	8.93	1.037	8.6295

Skimmilk Powder	.....	97.00	0.00	97.00	.....	.....
Wholemilk Powder	26.00	72.00	0.00	98.00	.....	.....
Granulated Sugar	.....	.....	100.00	100.00	.....	7.5000
Invert Sugar Syrup	....	.....	71.50	71.50	.....	10.0000
Corn Sugar	.....	.....	.....	90.00	.....	.....
Corn Syrup	.....	.....	82.00	82.00	.....	.....
Gelatine	.....	.....	0.00	90.00	.....	.....
Butter, Unsalted	83.00	.....	.....	84.00	.....	.....
Butter Oil	100.00	.....	.....	100.00	.....	7.5000

By combining three or more of the afore-mentioned substances in various amounts, Compounds of almost any composition may be made. The following illustrates the method used:

TRIAL MIX NO. 1.

	Gal.	Lbs.	% Fat	Lbs. Fat	Per Cent Skim Solids	Lbs. Skim Solids	% Sugar	Lbs. Sugar	% T. S.	Lbs. T. S.
Cream	60	510.0	30.0	153.0	6.24	19.34	.....	.....	36.24	112.34
Milk	40	344.0	4.0	13.76	8.55	29.31	.....	.....	12.55	43.12
Sugar	..	142.0	....	.....	....	.....	100.0	142.0	100.00	142.0
Gelatine	..	4.0	....	.....	....	.....	.....	.....	90.00	3.6
Gel. Water	3	25.0	....	.....	....	.....	.....	.....	.....	.....
Flavor	..	5.0	....	.....	....	.....	.....	.....	.....	.....
		1030.0		166.76		48.65		142.0		301.06

166.76 ÷ 1030 = 16.19% Fat.
48.65 ÷ 1030 = 4.72%.
142.00 ÷ 1030 = 13.78% Sugar.
301.06 ÷ 1030 = 29.42% Total Solids.

In this trial balance every item is wrong, except the sugar. The fat and the sugar are too high and the skim solids and the total solids are far too low. Now, keeping the total weight at about 1000 pounds, let us

INSULATION
for
COLD TEMPERATURES

LINOFELT

LINOFELT is used by nearly all manufacturers of milk and ice cream machinery for holding the temperatures necessary in these machines.

The MANNING MFG. CO., Rutland, Vt., have pointed out the superiority of LINOFELT in the following advertisement in this paper:

"UNCLE SAM NEVER LIES."

"In a recent test made by the Bureau of Standards, Washington, D. C., Linofelt was shown to have a smaller conductivity than corkboard. In other words, Linofelt was shown to be the better insulation. The Manning Batch Mixer is insulated with one inch Linofelt."

LINOFELT can be used equally well for insulating storage and hardening rooms.

let down the fat by the use of more milk and less cream; we could also use a little less sugar.

TRIAL MIX NO. 2.

	Gal.	Lbs.	% Fat	Lbs. Fat	Per Cent Skim Solids	Lbs. Skim Solids	% Sugar	Lbs. Sugar	% T. S.	Lbs. T. S.
Cream	40	334.0	30.0	100.2	6.24	20.84	.....	.....	36.24	121.04
Milk	60	516.0	4.0	20.64	8.55	44.12	.....	.....	12.55	64.75
Sugar	..	130.0	....	.....	.....	.....	100.0	130.0	100.00	130.0
Gelatine	..	4.0	....	.....	.....	.....	.....	.....	90.00	3.6
Gel. Water	2	17.0	....	.....	.....	.....	.....	.....	.....	.....
Flavor	..	5.0	....	.....	.....	.....	.....	.....	.....	.....
		1006.0		120.84		64.96		130.0		319.39

120.84 ÷ 1006 = 12.01% Fat.
64.96 ÷ 1006 = 6.45% Skim Solids.
130.0 ÷ 1006 = 12.92% Sugar.
319.39 ÷ 1006 = 31.74% Total Solids.

In trial No. 2 we have the fat fully low enough, the sugar about right, but the skim solids and the total solids are still too low. To correct these we must add condensed or dry milk. Let us try this by substituting 10 gallons of whole condensed milk for an equal amount of natural milk and note the effect.

TRIAL MIX NO. 3.

	Gal.	Lbs.	% Fat	Lbs. Fat	Per Cent Skim Solids	Lbs. Skim Solids	% Sugar	Lbs. Sugar	% T. S.	Lbs. T. S.
Cream	40	334.0	30.0	100.2	6.24	20.84	.....	.....	36.24	121.04
Milk	50	430.0	4.0	72.2	8.55	36.76	.....	.....	12.55	53.96
Cond. Wh. Milk	10	90.0	7.6	6.8	20.00	18.00	.....	.....	27.60	24.84
Sugar	..	130.0	....	.....	.....	.....	100.0	130.0	100.00	130.0
Gelatine	..	4.0	....	.....	.....	.....	.....	.....	90.00	3.6
Gel. Water	2	17.0	....	.....	.....	.....	.....	.....	.....	.....
Flavor	..	5.0	....	.....	.....	.....	.....	.....	.....	.....
		1010.0		124.2		75.60		130.0		333.44

124.2 ÷ 1010.0 = 12.29% Fat.
75.60 ÷ 1010.0 = 7.48% Skim Solids.
130.0 ÷ 1010.0 = 12.8% Sugar.
333.44 ÷ 1010.0 = 33.0% Total Solids.

In trial No. 3 the fat percentage is satisfactory, likewise the sugar, if it is high in price, but the total solids are still a little low. Let us try again and substitute still another can of condensed milk for the natural milk as follows:

PUMPS

The Blackmer is the silent partner on the job no matter how far the job is removed from the main plant.

Blackmer Rotary Pump Company

314 SHERIDAN ST.
PETOSKEY, MICH.

TRIAL MIX NO. 4.

	Gal.	Lbs.	% Fat	Lbs. Fat	Per Cent Skim Solids	Lbs. Skim Solids	% Sugar	Lbs. Sugar	% T. S.	Lbs. T. S.
Cream	40	334.0	30.0	100.2	6.24	20.84	.....	.....	36.24	121.04
Milk	40	344.0	4.0	13.76	8.55	29.41	.....	.....	12.55	43.17
Cond. Wh. Milk	20	180.0	7.6	13.68	20.00	36.00	.....	.....	27.60	49.68
Sugar	..	150.0	....	.....	.....	.....	100.0	150.0	100.00	150.0
Gelatine	..	4.0	....	.....	.....	.....	.....	.....	90.00	3.6
Gel. Water	2	17.0	....	.....	.....	.....	.....	.....	.....	.....
Flavor	..	5.0	....	.....	.....	.....	.....	.....	.....	.....
		1034.0		127.64		86.25		150.0		367.49

127.64 ÷ 1034.0 = 12.3 % Fat.
86.25 ÷ 1034.0 = 8.4 % Skim Solids.
150.0 ÷ 1034.0 = 14.50% Sugar.
367.49 ÷ 1034.0 = 35.54% Total Solids.

Trial No. 4 satisfies every requirement so far as chemical composition is concerned. The fat, 12.3 per cent, is nicely above the legal requirement and more than is required to produce a tasty product. The sugar, 14.50 per cent, is ample to produce the sweet taste called for, and the total solids, 35.54, are ample to produce a true food product and also to support or sustain the yield without danger of sagging or falling.

Using Butter and Skim Powder.

In many places cream in sufficient quantities cannot be secured at all times and this cream shortage often occurs during seasons of greatest ice cream consumption. To meet these conditions the use of butter and skim milk powder are regularly resorted to in formula much like the following:

TRIAL "A"

	Gal.	Lbs.	% Fat	Lbs. Fat	% T. S.	Lbs. T. S.	Price	Cost
Milk	70	602.0	3.7	22.33	12.00	72.24	.....	.....
Butter	..	110.0	82.0	90.20	83.00	91.30	.....	.....
Skim. Powd.	..	16.0	....	.....	97.00	15.52	.....	.....
Sugar	..	130.0	....	.....	100.0	130.00	.....	.....
Gelatine	..	4.0	....	.....	90.0	3.60	.....	.....
Gel. Water	..	25.00	....	.....	.....	.....	.....	.....
Flavor	..	5.0	....	.....	.....	.....	.....	.....
Water	..	20.0	....	.....	.....	.....	.....	.....
		912.0		112.53		312.66		

112.53 ÷ 912.0 = 12.33% Fat.
130.00 ÷ 912.0 = 14.15% Sugar.
312.66 ÷ 912.0 = 34.27% Total Solids.
..... ÷ 912.0 = Cost per pound.

The foregoing mix is fair, though a little high in fat and sugar. Let us try again.

Flavor	...	5.0	....	.....	.....	.....	.....	.....	.....	.....
		1000.0		123.85		130.0		335.55		

123.85 ÷ 1000.0 = 12.38% Fat.
140.00 ÷ 1000.0 = 14.00% Sugar.
348.90 ÷ 1000.0 = 34.89% Total Solids.
..... ÷ 1000.0 = Cost per pound.

This is a very fair mix from all standpoints.

Butter, Skim Powder and Water.

Very good ice cream may be made, however, from powdered skim milk, butter, and water, and much is being so made. Nor can anyone distinguish the difference between ice cream so made and that made from normal cream, for they contain and are the same substances. When the mix is made in this manner it will be somewhat as follows: using the oil from melted common butter, instead of unsalted butter to furnish the fat.

This is an easy one to calculate, for since we must have 12 per cent fat with a small margin of safety, and since 12 per cent of 1,000 pounds is 120 pounds we may put in 122 of butter oil and be assured of 12.2 per cent fat. Likewise, to get 13 per cent sugar in 1,000 pounds mix we shall need 130 pounds. Adding the fat and the sugar percentages we have (12+13=25) 25 per cent of our needed 35 per cent total solids. Therefore, the difference, 10 per cent, must be made up of skim powder, or 100 pounds. Doing this we have as follows:

TRIAL "C"

	Lbs.	% Fat	Lbs. Fat	% Sugar	Lbs. Sugar	% T. S.	Lbs. T. S.	Price	Cost
Butter Oil	122.0	100.0	122.0	.....	.....	100.0	122.0	.....	.....
Skim Powder	100.0	.....	.....	.....	.....	97.0	97.0	.....	..
Water	639.0	....	....	....	....	....	....	.....	.....
Sugar	130.0	.....	.....	100.0	130.0	100.0	130.0	.....	.....
Gelatine	4.0	....	....	....	....	90.0	3.6	.....	.....
Flavor	5.0	....	....	....	....	....	....	.....	.....
	1000		122.0		130.0		352.6		

122.0 ÷ 1000 = 12.2% Fat.
130.0 ÷ 1000 = 13.0% Sugar.
352.6 ÷ 1000 = 35.26% Solids.
..... ÷ 1000 = Cost per pound.

To find amount of water needed for the above the total of all other ingredients are subtracted from 1,000, and the difference is the amount needed.

Ice Cream from Powdered Mix.

The first powdered ice cream mix ever made in commercial quantity and quality, if not in fact the first ever made, was produced by R. M. Washburn, in 1920. The mix is a compound of all the essentials of standard commercial ice cream, except flavor. To use it is simply necessary to dissolve the required amount of powder in water, let stand a few hours to regain viscosity, then flavor and freeze in the ordinary way.

TRIAL "D"

	Lbs.	% Fat	Lbs. Fat	% Sugar	Lbs. Sugar	% T. S.	Lbs. T. S.
Powdered Mix	350.0	35.0	122.50	38.0	133.0	98.0	343.0
Water	650.0	....	.....	....	.....	....	.....
Flavor	5.0	....	.....	....	.....	....	.....
	1000.0		122.50		133.0		343.0

122.5 ÷ 1000 = 12.25% Fat.
133.0 ÷ 1000 = 13.30% Sugar.
343.0 ÷ 1000 = 34.30% Total Solids.

The powder is made to contain all the essentials in right ratio and to fit various state standards.

Pasteurization of the entire mix (except flavor) has now become almost universal, and is to be favored as producing a better article than can be made from raw creams.

Homogenization of the entire mix as it comes from the pasteurizer is also quite common. It produces a smoother, creamier, meatier ice cream than can be made without it. Washburn's Powdered Mix has been both pasteurized and homogenized.

Standardizing Viscosity.

No freshly prepared mix is ready to freeze. It is too loose and sloppy, but let it stand cold, 24 to 48 hours, and it will regain viscosity apparently by the reuniting of the threads and shreds of casein into tough and comparatively long strings.

A light bodied mix will not retain the air beaten into it, but a vicid one will. Viscosity of mix may be hastened and uniformity assured by the use of some good enzyme viscosity improver or controller.

The art of making ice cream has passed from the realm of the rule of thumb and of mystery to that of science in a decade.

SAFE ICE CREAM

Published by ALFRED PURE ICE CREAM CO., Los Angeles, Cal.

Welcome Ideas for Social Evenings

By ANDRE DUPONT

An April Birthday Party

By EDGAR A. JORDAN

SAFE ICE CREAM is a monthly magazine designed to make the American Housewife respect ice cream as a delicious, healthful dessert for *everyday* use—not a child's "treat" or a "luxury" for great occasions!

ALFRED *of* LOS ANGELES

says—"It is going to be necessary for you to increase our order another thousand copies of SAFE ICE CREAM * * * "

(that's how this letter starts:)

THE ALFRED PURE ICE CREAM CO. of Los Angeles is one of the most progressive, thriving manufacturers of the Pacific Coast. Read their letter *twice*. They got 1700 *new* customers in 3½ months, proving that Safe Ice Cream *does do the business* with the consumer. You may not do business direct with the consumer . therefore — use S. I. C. as your *dealer-aid* so that *he* can get ice cream across (in the big "day-by-day dessert" sense) to *his* consumers. The more he sells the more you'll sell him.

C. J. ALFRED, PRESIDENT — H. P. TAYLOR, VICE PRES. — R. J. POWELL, SEC. & TREAS.

ALFRED'S ICE CREAM

ALFRED PURE ICE CREAM CO., Inc.

MAIN OFFICE 817-19 EAST 18TH STREET
CREAMERIES HIPTON CAL

LOS ANGELES, CAL.

December 14, 1921.

Frederick C. Mathews Company,
Detroit, Michigan.

Gentlemen:

It is going to be necessary for you to increase our order another thousand copies of SAFE ICE CREAM for February as our mailing list now exceeds our supply of magazines.

We wish to take this occasion to tell you of the gratifying results we have derived from the use of your monthly booklet in our city, and we are sure the figures taken from our sales records will prove interesting to you.

Our first mailing list which we compiled from retail customers' ledger on September first contained about thirteen hundred names for the city of Los Angeles, and today we have three thousand names. In other words we have taken on seventeen hundred new customers since the first of September - about three and one-half months.

As stated above, our original mailing list was composed of names from our old customers' ledger, and a large number of these had made one purchase only from the first of the year to September - nine months. But since we have been mailing them our SAFE ICE CREAM every month they have been reordering regularly. For instance we had twenty five repeat orders on Thanksgiving and about thirty new customers, and last Saturday, December 10th, we had nine new customers.

This is the first time we have ever been able to check the results of advertising, but the system we have installed proves absolutely that our new customers and repeat orders are directly due to the work of your little booklet, and we want to thank you for calling it to our attention and wish you all the success possible. It has certainly brought results away beyond our expectations.

Yours very truly,

ALFRED PURE ICE CREAM COMPANY

CJA-S

C. J. Alfred
President

Look on the other side of this sheet and see the cover design (actual size) of Safe Ice Cream—the magazine Mr. Alfred is referring to in his letter. This magazine is going into hundreds of thousands of homes every month. SAFE ICE CREAM would work just as effectively for you as it does for Alfred Pure Ice Cream Company of Los Angeles

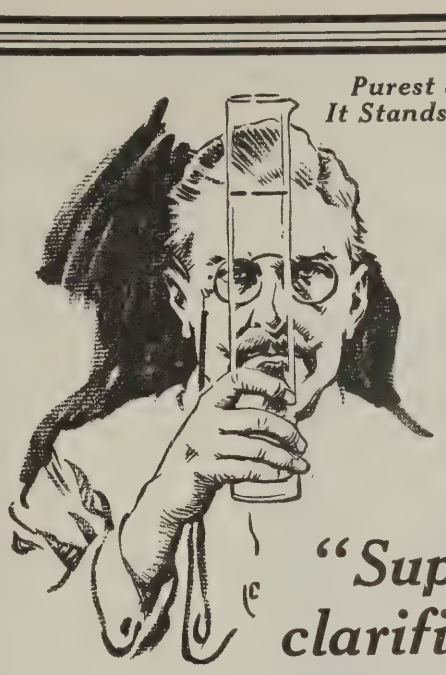
This insert was produced complete by the Frederick C. Mathews Company, Detroit, Michigan

ICE CREAM FACTORY FOR CHINA.



At last America is going to have an opportunity to reciprocate for its introduction to chop suey. China's first ice cream factory is having its inception at Fresno, California, where a company composed almost exclusively of Fresno Chinese merchants has been organized, with a capital of $160,000.

This company will erect and operate an ice cream factory at Canton, China, just as soon as Chinese government transactions, now in process, are completed. The building will be a three story modern concrete structure, and will be fitted with modern American machinery and equipment.

With dairying in its present undeveloped state in China, it will not be possible for this firm to obtain the necessary milk and cream from local producers, therefore they will use milk powder and sweet butter which they will import from America.

The name of this company is the Jone-Wah Ice Cream Company, Ltd., and the officers are: Lew Gun Yuen, president; C. H. Yuen, vice-president; Lee Toy, treasurer; Fong Q. Jing, secretary.

The organizers of this company are entering their work with all the enthusiasm of missionaries of a new faith. It is possible that tradition has established habits among the Chinese that will retard consumption at first, but this will no doubt be readily overcome, and this impetus to the dairy industry of that country may eventually benefit the entire nation. It may not be an unaccustomed sight in a few years hence to see swarms of Chinest children eating ice cream cones.

QUALITY ICE CREAM COMPANY NOW IN NEW PLANT.

The Quality Ice Cream Company of Neosho, Missouri, which has recently been organized, is an outgrowth of the Tulsa, Oklahoma, concern of the same name.

Needing a larger supply of sweet cream in its operations than was obtainable locally, the Tulsa concern in 1921 began looking for a suitable location for a branch to meet this requirement; after careful consideration, on account of the abundant supply of good milch cows in Newton County, Missouri, and the good railway connections between its county seat, Neosho, and Tulsa, it was decided to establish a branch at Neosho, and this was done in November, 1921.

It was not originally intended to operate the Neosho branch as a manufacturing plant, but, as time went on, it was seen that a good trade territory could be reached by the several railway and trucking lines serving Neosho. Accordingly, early in the spring of 1922, the Neosho branch began the manufacture and distribution of ice cream and kindred products, in addition to the buying and separating of sweet milk.

The manufacturing business showed such attractive possibilities that it was decided to incorporate, and, with the issuance of a charter May 23, the Neosho branch entered into a separate existence as the Quality Ice Cream Company, with the following officers, all experienced in their chosen line of work, in charge: W. M. Hawk, President; Mrs. H. W. Wolfskill, Vice-president; H. W. Wolfskill, Secretary-Treasurer.

The business is conducted in a building formerly occupied by the Neosho Creamery Company. Members of the firm state that the present quarters have been outgrown even this early in the history of the business, but it is probable that no change will be made during the calendar year.

Purest and Best
It Stands the Test

"Super-clarified!"

Months of ceaseless endeavor, constant striving for the development of a process of making a purer and clearer gelatine, consistent selection of only the finest of raw materials—these things have resulted in

ATLANTIC

—a super-clarified—

GELATINE

When seen in the solution its wonderful purity and clarity is apparent at a glance.

Not only will Atlantic pass the pure food requirements of any State in the Union, but it permits of greater economies. Grade for grade, it costs less and does more than others.

We Can Prove Its Merits

Send for a barrel of Atlantic Gelatine now. Use five, ten, or even fifteen pounds. If, after a fair test, you decide Atlantic isn't what we claim, send back the unused portion and we'll pay the freight both ways. The test is free if you decide Atlantic isn't your gelatine.

We make this offer because we're certain Atlantic — super-clarified gelatine — is best and will save you money.

"Co-operation with the Public"

Address of F. ELLIS MILLER, before Pacific Ice Cream Manufacturers' Association, Seattle, Nov. 14, 15, 1921.

The discussion of co-operation among ice cream manufacturers is fundamental. We have had this subject before us in every convention program for years past. I am going to treat it from a different angle to-day. If the great war has taught the average business man or average American anything, it has taught him that he cannot get along by himself. The nations of the world found this out at great expense of blood and treasure.

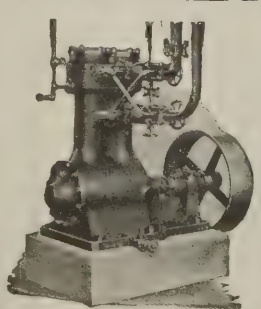
F. E. MILLER.

We cannot go back to individualism in our business life. The old motto "everybody for himself and the devil take the hindmost" has passed out forever. In its place we have a new motto, "All for each and each for all." We have found out "we are our brother's keeper."

In my state, California, co-operation between the producer and the public was given a substantial impetus some years ago by the creation of a State Market Director, whose duty it is to bring producer and consumer together, to spread throughout the state educational information of food products, to fix prices in some instances and to co-operate in any manner that will tend to prevent fictitious prices. For instance, it is a common thing to see display advertisements in California papers telling of the official price of fish, and signed by and inserted by the State Market Director. As may be supposed bitter fights have been made against the functioning of this office, but without avail. As the public mind becomes educated along these lines it may be assumed that such co-operation will be extended in scope.

However, there are instances where men engaged in the same line of business have misused the co-operative principle to exploit the public for their own selfish purposes,—this is co-operation run mad against the public and should be condemned. This brand might well carry on its coat of arms the legend, "The public be damned."

Much of the best efforts of Congress, or state legislatures, and of municipal government have been directed in recent years against this kind of co-operation generally classified as a "Trust or Combine." But the entire environment of a business man who co-operates with the public is altogether different.



Since there can be no real and successful co-operation with the public without confidence, my remarks must perforce deal with the most practical and intelligent methods of earning the confidence of the consuming public. It is easier to talk about it than to do it.

Nor can business be maintained on "past performances" except insofar as the bulwark present performances. Let an ice cream man put out a splendid quality of his product for five years, then put out an inferior quality. You all know what would happen. The slogan, "Always the best" would get him nowhere. The judgment of his customers on what he is giving them to-day would seal his fate. He would have lost the confidence, the co-operation of the public, and he would automatically pay the penalty.

Experience has taught all of us that the policy of inviting the public to sit in at the game and of putting all our cards on the table, face up, is the policy that wins. All business is a contest between the producer and consumer, but with one great difference from other kinds of contests. The public always "plays square." Ever think of that? In the very nature of things the public gives you a square deal till you convince it that you don't deserve it; then it quits you. Doubtless every manufacturer here can look back and recall many "ups" and "downs" in business. But at no time does the level-headed business man lose sight of the fact that his greatest asset is public confidence. Should unprincipled competition be directed against him (an experience not at all uncommon) the discerning public, because of the confidence he has earned, will stand by him. Let the public know the facts, take it into your confidence, openly and squarely, and it will reciprocate every time. I have had ample proof of it, so have many of you.

It is common in our line of business for those who co-operate for purely selfish purposes, to launch their shafts at those who practice co-operation with the public and who are classed as "independents." Such tactics more often hurt the offenders more than those they would harass. The public mind is a dangerous thing to toy with. It is remarkably discerning and it is absolutely for the square deal when it knows all the facts.

Cudahy, Wisconsin

Win public confidence, and keep it if you would hold and increase business.

But how? That is indeed a question, but not difficult for the experienced manufacturer to answer. The very first advance toward winning public confidence must be made in the organization of your business. Have perfect co-operation between every employee and every department. It would be presumptuous for me to go into detail before a representative body of ice cream makers. But let me emphasize a point of which we sometimes fail to appreciate the full significance.

We are apt to take it for granted that the public knows as much about our business as we do. They know nothing but what we tell them, and what we do for them. Ice cream is a 100 per cent thing to us; it is a comparatively small thing to the great public.

And just as surely as confidence is the basis of genuine, beneficial co-operation, so is intelligent and generous publicity, the invitation and the stimulant to public confidence. Here, of course, the prime factor is printer's ink. Do not think for one moment that your publicity is something in the nature of the tail to a kite. It is a large and essential part of the kite. I would make the criticism, in passing, that ice cream men have been altogether too moderate in their use of printer's ink. Select your publicity man as you would the manager of your factory. Do not lull yourself into the dream that because you have been doing business in your town for years that you need not advertise. I have said that the successful man must win public confidence. I also said that he must keep it and he cannot keep it if he leads the public into the belief that he is dead. The sun's rays of yesterday are not illuminating Seattle today. The memory of our last convention banquet will not satisfy my appetite this evening. No longer can we ignore the proper advertising of our business with the remark, "I have no time to write ads." Of course a busy man has not time to write ads; few have. Neither has he the time or the knowledge to care for the highly efficient plant that runs his factory. Get the services of the best publicity man you can find and turn him loose on the job. He'll get more returns for your money than the ordinary ice cream maker would think of.

Publish nothing but the absolute truth, but present it in a way that cannot be misunderstood or misinterpreted. No matter how original or unusual your advertising may be, judge it only by its common sense, forcefulness and results.

But while newspaper advertising may be given the place of first importance it must not be considered as the beginning and end of necessary and successful publicity. When a special or unusual combination of circumstances seems to demand it, a house-organ may be used with telling effect. I brought with me, for your edification or amusement, as the case may be, some copies of a little magazine called "The Housewife" that we published last summer and which tells its own story. The results far exceeded my anticipations.

Too much stress cannot be laid upon the value of personal contact with the public at every point that seems proper and expedient. There is a psychological principle in this phase of cultivating co-operation with the public.

There are many lines in which the public is largely indifferent as to personality of the maker. For instance, kitchenware, blankets, furniture, and so forth. But the ordinary housewife does like some degree of personal knowledge of those who supply the family food,—the grocer, the baker, the ice cream maker.

As good business men, we are members of our local Chamber of Commerce and similar organizations. Be not content with merely sending a check for your annual subscription. Take an active part in the actua constructive work of such bodies. Let it be known that you are a "live one" and ready to serve on committees and to do what a progressive merchant should do to foster local development. This is solid work, and brings us in direct contact with the forces that are making for material progress. Often, you will be asked to speak at clubs, lunches, housewives' leagues, and so forth, on your particular business. Respond freely and give a little time and thought to what you will say. Remember that not only you, but your business also, is under review and take the fullest advantage of all such legitimate opportunities to reach the public.

There is one avenue of approach to the public heart that can always be cultivated and which is always "bread cast upon the waters." This is a generous treatment of the kiddies in the schools. There is a vast amount of concrete pleasure and satisfaction in "taking care" of the kiddies, outside of the ultimate result in actual business. For their benefit year ago, I popularized the nickel ice cream cone when ice cream was a high priced luxury. Today thousands of these kiddies are now parents and believe me, they are real boosters for the firm that first won their confidence and good will years ago.

In this connection I will tell you—if you will pardon personal reference—how I brought 25,000 children and grownups for a day's outing at Idora Park, last spring. I distributed 250,000 tickets among our dealers. The tickets were good for admission to the Park on payment of one cent war tax and could be had only by calling at our dealers' for them. Wide publicity was given through the daily papers. Every person who came in at the park gate received a long ticket with attached coupons, each coupon good for one of the various concessions and an individual brick of ice cream. The free ice cream seemed to draw as much as the amusement of the park. It was a wonderful day, and we are going to make an annual event of it. It not only helped our firm but was a great boost in promoting the sale of ice cream.

Am relating this to you because doubtless any of you can do the same thing by utilizing some popular playground in your own community.

Another personal feature was the entertainment of the wounded veterans and soldiers of the world war, stationed at Letterman Hospital, on Decoration Day. A wealthy citizen at his own expense had been doing this for years and for some reason or other, this year the soldiers were about to be disappointed until the ice cream man undertook the job, and it was very easily accomplished. Friends donated automobiles to move them to the Ferry station and the Key Route dead-headed the men across the bay. The war mothers of Oakland were only too glad to contribute cakes and sandwiches and their services. The nurses contributed fully two hundred cakes. Business firms contributed fruits, cigars and cigarettes. Young ladies were on hand to dance with the convalescents. Newspapers gave very finest publicity about the ice cream contributed for the fact that the whole day's pleasure was made possible by the ice cream man, and could not help but give the industry favorable comment.

This may seem rather spectacular, but a little reflection will see that this is only one way to reach the public and that you can easily adapt some features of it to boost the game in your home town.

Another feature that has shown good results is the giving away of small cards entitling the bearer to an ice cream brick with our compliments, when presented at the factory. Church bazaars and societies are contin-

ally giving away prizes as an entertainment feature nd one-half dozen of these orders for ice cream bricks re very much appreciated as prizes.

We also use these complimentary orders as birthay presents. In our state, up until two years ago, every perator of an automobile had to give his age and birthay. This furnished us with a partial list of names. It ertainly brings your firm very much in touch with the ome if the mother or father get a letter of congratulaion on the morning of their birthday enclosing a ticket ood for a quart brick of ice cream. If you are enaged in delivering family orders, this will be of inesimable value.

As one means of laying-down our cards face-up, it as been amply proven that one of the greatest elements n winning public confidence is to encourage the people o visit our plants and see how the ingredients of our roduct are handled and how ice cream is made. Keep pen a standing offer to adults, and to children with heir parent or guardian, to inspect your plant and to eceive a brick of ice cream for their trouble. I have nown it to require the constant services of a guide o show groups of visitors through the plant, and each ne of the thousands of visitors obviously become a good dvertiser for the business and its proprietor. The impression they receive of the sanitary handling of everyhing, the modern machinery, and the scrupulous cleaniness everywhere never leaves them. It makes for popular cooperation of the most valuable kind. When they et home and enjoy their free brick, it possesses added nterest from the fact that they have seen exactly what t is made of, and how it is made. Each brick probably nakes four personal friends.

For fifteen years I have worked without cessation o build up the ice cream business in my city, Oakland. To cooperate with the public and to earn its confidence as always been my aim.

The times are changing—a quiet evolution is going on; it is unlikely that we may return to pre-war conditions. Our industry is face to face with new environment, new obstacles and new opportunities.

Few lines of business have shown greater growth n recent years than the ice cream business. Few years ago the ice cream man was little thought of, today he s a prominent factor in the public eye. The public is nterested in the ethics of our business.

The time is coming when the standard for our ice ream industry will be so high that every man here will realize more fully than we do now, that each one s a part of his industry, and not merely a part of his firm. Also, that every man's relation to his industry must be as honorable as his dealings with his own firm.

We will then learn that our duty is not only to our own business and success but to work for the advancement of the industry as a whole. When we are prepared to take this forward step, the holding of public confidence is assured.

Approximately 90 per cent of the milk consumed in Los Angeles, 75 per cent of the bread, and 500,000 pounds of fresh meat daily are delivered by motor truck.

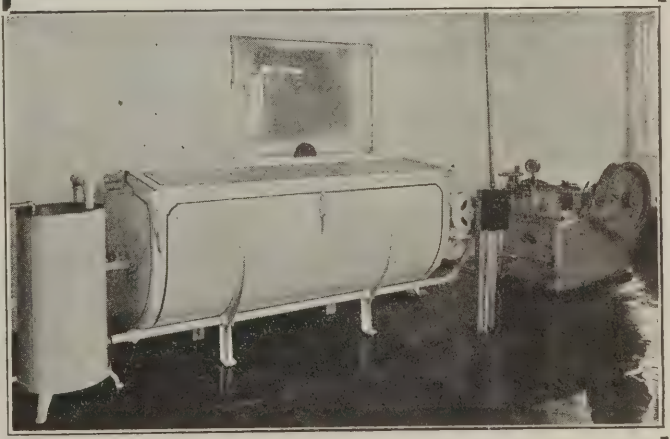
Pasteurizing The Batch!



Many ice cream manufacturers are devoting as much attention to making a *safe* ice cream as they are to putting out a product of fine flavor and texture. Among these is the Tauber Absopure Ice Cream Company, of Chicago, Illinois, whose plant is considered one of the most unique in the country devoted to the manufacture of ice cream.

All Tauber Absopure Ice Cream is made and pasteurized in a Manning Batch Mixer, giving the Tauber product the advantage of assured safety through double pasteurization.

Babe Ruth Knocks Five Thousand Home Runs

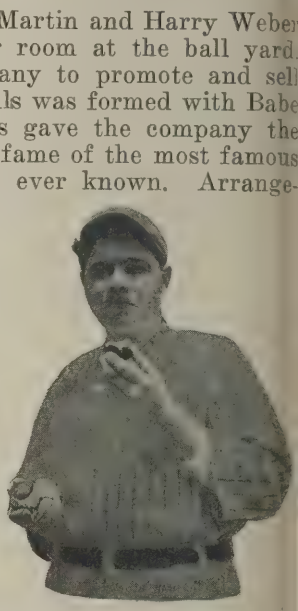
King Bambino of the Land of Swat Makes a Record Hit When He Tosses Chocolate Coated Ice Cream Baseballs into the Stands

It was a hot day on the Yankee's Home Grounds.

The blue-coated brass band in the loge had just finished "Hail to the Chief" as Babe Ruth, Home Run King of the Base Ball World, walked out to the home plate, dusted his hands in the dirt at his feet, swung three bats over his head a couple of times and then smashed out a high liner straight into the center field bleachers ANOTHER HOME RUN.

Around the bases plowed the Bambino to the blare of the band and the cheers of his admirers who filled the stands. As he galloped around third base and into the home stretch, the cheering grew to an ovation and perfectly good straw hats were smashed in the excitement which only a homer from the bat of Babe Ruth can inspire.

As he trotted back to the dugout, doffing his cap to the cheering crowds, a young man tossed a ball wrapped in silver foil to the Home Run King. Instinctively the baseball player caught it, looked at the foil wrapped ball in his big hand, cocked his head inquisitively and then slowly, in front of the admiring thousands, he unwrapped the foil and his face broke into a broad grin which deepened the sun wrinkles of years of campaigning in his face. Then he buried his teeth in the chocolate coated baseball.



"Oh, Boy," he said as he bit into the crisp cold confection in his hand.

It was Babe Ruth's introduction to the original Chocolate Coated Ice Cream Baseball which has proved as big a hit at the confectionery box office as Ruth has at the baseball turn-stile.

Anticipating just exactly what would happen at this, New York's introduction to the Ice Cream Baseball, Royce G. Martin, president of the company promoting the Chocolate Coated Baseball, had had a flock of these frozen confections made downtown at Horton's factory.

After Babe and the rest of the team had eaten their fill of these delicious confections, they began tossing the Baseball into the grandstand. It was a riot. Everybody wanted a high wide one from the hands of the mighty swatman and in no time five thousand were consumed by the hungry fans.

After the game, Ruth, Mr. Martin and Harry Weber talked turkey in the dressing room at the ball yard. Right there the eastern company to promote and sell Elite Chocolate Coated Baseballs was formed with Babe Ruth as Vice President. This gave the company the exclusive use of the name and fame of the most famous baseball player the world has ever known. Arrangements were also worked out by which Ruth will personally redeem the foil wrappers of the Chocolate Coated Baseball with a regulation league baseball with his autograph written on the horsehide cover. Advertising copy, cut-outs, wrappers with Babe Ruth's signature on them and all of the other details of promoting the sale of Baseballs were worked out while President Martin was in the East.

The result has been that Babe Ruth Home Run Baseballs are now as well known as the Swat King himself, and the demand is increasing so rapidly that the parent company is having difficulty in meeting the demand for supplies from its warehouses. Babe Ruth Home Run Baseballs are now being eaten wherever ice cream is sold and traveling representatives are introducing the sales promotion plan and simple method of manufacture from coast to coast.

OFFICERS OF THE BABE RUTH HOME RUN CORPORATION.
1. **Harry Weber, Jr., President.**
2. **"Babe" Ruth, Vice-President.**
3. **Royce G. Martin, Secretary and Treasurer.**

For ten years experiments and tests were made with two flavors of ice cream coated with chocolate until the product was pronounced perfect by a confectioner who had had years of practical experience in merchandising frozen confections. The product was then given the acid test of the open market. Without any promotion or advertising, it was offered to a limited public in order to study the reactions of the buyer to the novel ice cream offering, in order to ascertain whether or not it had a repeat value without which no confection can long survive. The results of these somewhat extensive and elaborate tests was that the Chocolate Baseball grew in favor until the demand reached a point where it was placed on the market in wholesale quantities.

This required a carefully organized sales and promotion organization in addition to national and local advertising campaigns studied from the consumer stand-

RIECK'S

IN Pittsburgh and the territory within seventy-five or a hundred miles, the name RIECK is synonymous with good Ice Cream. Newspapers, Posters, Signs and Window Displays continually remind the passerby of *Rieck's Ice Cream*. For a generation it has been the standard of comparison and the fame of the great *Rieck-McJunkin Dairy Company* is nation-wide today.

Twelve years ago we commenced advertising Rieck's Ice Cream and the pleasant relationship still continues. We believe they will gladly tell you of our service if you ask them. If you desire specialized, experienced service covering every feature of tried forms of advertising write today. We are planning next year's campaign and if we are not serving a client in your territory we should like to serve you.

point and with a view to emphasizing the wonderful appeal to the appetite and taste the bitter sweet chocolate coating and the two flavors of pure ice cream had. Francis O'Neill was made Sales Manager by President Martin and at once started to train a crew of experienced salesmen in the merchandising of these Chocolate Coated Baseballs. Factory experts were also organized to teach the manufacturer how the comparatively simple process of manufacture was carried out to get the maximum results. These merchandising efforts were backed up by both national advertising, local publicity and sales promotion plans emphasizing the fact that such an article must have the repeat, resale demand to make it a permanent money maker for the manufacturer.

The blend and flavor of honey sweet chocolate, vanilla and Chocolate ice cream to sell for a dime met the demand of the public for a frozen confection which tasted like more. Creating its own desire for an encore, the Chocolate Coated Baseball is proving to be one of the biggest money makers for the manufacturer and retailer that has ever been offered the ice cream trade.

Being an all-year confection, arrangements are now being made to push the advertising and sale of Baseballs during the fall and winter months and Babe Ruth will assist in this promotion work personally as soon as the baseball season closes, insuring its being kept before the public through national and local advertising and Babe Ruth's own brand of publicity and promotion.

The W. S. Hill and Ivan B. Nordhem Companies of New York, who are internationally famous in the advertising world, have been employed by the company to prepare the newspaper and out-door poster advertising campaign which the company proposes to spend $250,000.00 on. The interesting thing about the advertising policy for the Babe Ruth Home Run Chocolate Coated Baseball is that it is not going to be one grand splash but will be continuous the year around. The company feels that this is the only way to give the ice cream manufacturers one hundred per cent co-operation and support in the sale of the Babe Ruth Home Run Chocolate Coated Baseball.

The Boedeker Manufacturing Company, the well known ice cream manufacturer of Dallas, Texas, opened the selling campaign on the Chocolate Coated Baseball in the middle of July and in spite of hot weather, the sales were so great that they had to wire for several hundred thousand additional wrappers to meet the demand.

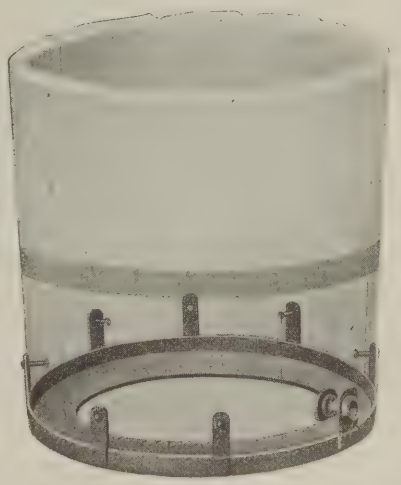
⚜

SWEET TOOTH OF PUBLIC AID TO PROSPERITY.

The urchin who eats an ice cream cone, and all others who consume this frosted sweet, are doing a larger share than is generally known in restoring prosperity and happiness to the farm, according to Guy H. Hall, director of the National Institute of Progressive Farming.

"When I was a boy," said Mr. Hall, "ice cream was a holiday treat. Now it seems to be an every-day commodity. In collecting data on the dairy situation, I learned recently that one million of the twenty-three million producing dairy cows in this country are, so to speak, in the ice cream business.

"Perhaps the dry law has something to do with it, but in any event this increased farm revenue is even now reflected in increased sales of farm lighting plants, tractors, power driving implements, automobiles and the like, which are doing so much toward making farm life more agreeable and prosperous. And the sweet tooth of the public is doing its bit in this direction."



Protection where the wear is most

Just as walking on cement floors prematurely destroys the life of a pair of shoe soles, so does the "skating" of ice cream tubs on railway or shipping platforms shorten their usefulness thru an early wearing out of bottoms.

FRICK Bottom Hoops

assure a maximum life for every ice cream tub.

These heavy bands of specially formed steel fit snugly around the bottom of any standard ice cream tub. They keep the staves from shredding away, permanently hold every stave in place and prevent the bottom from falling out.

Order a few for trial their cost is reasonable

FRICK HOOP CO., Corsicana, Texas

HITS THE NAIL ON THE HEAD.

Mr. Henry W. Stern, manager of The Daigger Corporation, Chicago, and known to the ice cream world as "Henry W.," wrote us a letter recently in which he paid his respects to one A. W. McCann. We quote as follows:

"In further reference to Mr. McCann's tirade against ice cream, would like to add that in the event of any chemist picturing H2O (water) giving magnified views of the various bugs and animals that crowd the ordinary drinking water, we believe that a large campaign on this basis would kind of spoil your appetite as well as mine for water, and we would all start in to drink 'moonshine.'

"We realize that there are certain kinds of bacteria that are desirable bacteria, and on the other hand the kind that are undesirable.

"We would hate to have Dr. McCann start in telling us about drinking water; as a matter of fact, we don't believe he ever will, because drinking water wouldn't hit anybody except the municipality, but would hurt some individual interests such as those people that sell spring water or distilled water, and certainly we doubt if he would want to aid anybody in their work."

OBEDIENT BOY.

Willie was almost through his reading lesson when he came to a word he could not pronounce.

"Barque," prompted the teacher.

Willie looked at his classmates and laughed.

"Barque, Willie!" exclaimed the teacher harshly.

Willie, looking up at the teacher, finally cried out, "Bow-wow!" — Western Christian Advocate (Cincinnati).

That Coal Pile

By Edwin Kayser

IN THIS era of progressive management and cost abridgement, a large proportion of the smaller industrial corporations lose sight of the fact, that an additional substantial saving could be effected were a more detailed study made of power plant efficiency. Indeed, only too many of these concerns are simply contented to let their engineer manage the power plant as he sees fit to do so, giving little consideration to a vast saving in dollars which could be made possible, were some capable fuel efficiency expert called into consultation.

Keen business competition, with the return to normal, behooves us to include in our personnel a competent combustion engineer, whose advice and recommendations should be acted upon. In the near future every manager will be required to know something regarding fuel economy, or will at least have the foresight, to call into consultation someone versed in this study.

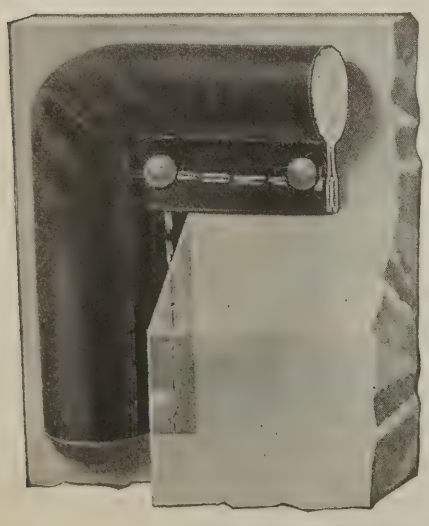
Feeding fuel to boilers and producing steam therefrom is the work of a fireman. Unless he is particularly ambitious his knowledge of power-plant efficiency is very limited. In general, he receives his instructions from the plant engineer, whose education fits him to take charge of the boiler room and power plant. It is safe to assume that the average engineer, in the small industrial plant, has had little opportunity to study fuel economy.

Am I buying the most economic A1 grade of coal? Do I derive a maximum efficiency from my present equipment, or could I make alterations so as to improve on what I have? Am I utilizing my exhaust steam to the very best advantage? These are pertinent questions every manager should ask himself. If there is any doubt in his mind as to the answer, it will be well worth while for him to investigate.

Pigs is pigs, and coal is coal; is a shortsighted way of regarding your coal pile.

One may rest assured that in the plant, where power and coal conservation are neither known or respected, it is a certainty that many misuses are being made of live steam. With a little careful attention these could be avoided. Check this up with your engineer. Call his attention to the escaping exhaust, power that you have already paid for, and still with a "good kick" in it. There being numerous ways of utilizing this paid for energy.

To serve as a demonstration what, with a little detailed study, can be accomplished in the way of cutting down overhead expenses, the writer in February, 1921, took over the management of a large dairy plant. Previous to this date the plant was being operated as a milk condensary. Coal could be purchased for $4.05 per ton delivered. The engineer was a man of average capability. I was assured that the plant was running about 56 per cent efficient. Subsequent tests showed this to be only 47 per cent.



Preliminary to conducting any extensive tests and for the purpose of ascertaining just what economic improvements were advisable, several weeks were spent by the writer and engineer, in a detailed study of all equipment.

Here and there we found some machine operating with excessive pressure. Adjustments were made accordingly. A Foreman bottle washer, which was being used for washing dirty milk bottles by using boiling water and live steam, was connected up with the exhaust steam. The results being just as satisfactory. Three large 5,000 pound holding vats, surrounded with steam jackets, for heating and holding the milk at a temperature of 145 degrees for a period of thirty minutes, were using live steam for heating. The steam connections were broken and exhaust steam connections substituted. Throughout the plant we found many small leaks too numerous to record.

The results were indeed gratifying, the saving on the coal pile in a month's operation immediately perceptible. Instead of using approximately 230 tons of coal per month we dropped down to 185 tons. An actual saving of over $2,000 per annum, and this simply by cutting down on the small leaks and making the exhaust steam perform actual work.

Experiments were then conducted to ascertain if the proper kind of coal was being used, both as to quality necessary for our requirements, as well as to price.

After running tests on various kinds of coal it was found that screenings, which had passed through a 2 inch grizzley and cost $2.51 per ton delivered, gave excellent results. Attention must be called, however, to the fact that the boilers were neither being forced, nor did they have to maintain at any time, a pressure greater than 95 lbs. per square inch. The equipment of the boiler room consisting of six boilers of 150 horse power

The Flavor Is Retained

WHEN Hudson's Vanilla Flavored ice cream is consumed in the home, its delicate, delightful, pleasing aroma is still present in all its original strength and goodness. The flavor does not freeze out—nor has it changed any in degree. Its quality and strength are of a character which positively assures retention. This is a feature we watch and guard closely in making our flavors. Careful laboratory tests by expert, skilled chemists determine and establish the keeping qualities of every gallon which leaves our factory. Further, we absolutely guarantee this feature.

Ice cream manufacturers who have been using Hudson's Flavors regularly and continuously for years, implicitly bank on this "non-freeze-out" characteristic. It has never failed them. Send for sample keg of our Extract or sample gallon of our CONCENTRATED. Give same a fair trial. You will readily recognize its quality; use up the entire sample, reorder and purchase regularly thereafter nothing but Hudson's. That's usually the history of all our customers.

each; of this battery, only two boilers being in operation at one time, and these fired by hand.

The cost of this slack for evaporating 1,000 lbs. of water from and at 212 degrees amounted to $.115, against a previous cost for the egg coal of $.178. At the same time the efficiency of boilers, including grate, (based on dry coal) only decreased 3%. These exceptionally good results could never have been obtained had the slack been of an inferior quality, as the following analysis will testify:

Moisture	7.85%
Volatile	39.10%
Fixed Carbon	40.72%
Ash	12.33%
Sulphur	3.13%
BTU Dry	12,558

The knowledge gained from conducting these tests actually saved the company a coal bill of $3,600 per annum.

Any superintendent or manager, who cares to devote a little study and application, is capable of running a fuel economy test. For the guidance of those, who have had no experience along these lines, the following simplified data will suffice. Be it understood, that while this is not a complete set of rules, still enough information will be obtained by following them to give some very interesting results.

For your calculations it will be necessary to secure a set of steam tables, and tables giving factors of evaporation. It will be necessary for the engineer to make suitable connections for weighing your boiler feed water, unless you desire to install a water meter.

In conclusion there are only three results you are interested in obtaining:

1. The cost of coal required for evaporating 1,000 lbs. of water from and at 212 degrees.
2. Water evaporated per pound of coal.
3. Efficiency of your boilers.

The first will vary greatly, depending upon the cost of coal delivered. The second, in good practice should run between 6.5 and 7.0 pounds. The third should never fall below 50%.

Rules for Conducting Boiler Tests.

Total Quantities.

1. Weight of coal as fired.....lbs.
2. Percentage of moisture in coal.....%
3. Total weight of dry coal fired (Item 1-Item 2)..lbs.
4. Total ash clinkers and refuse (dry).....lbs.
5. Total combustible burned (Item 3-Item 4).....lbs.
6. Per cent of ash in coal as fired.....%
7. Total weight of water fed to boilers.....lbs.
8. Factor of evaporation based on temperature of water entering boiler and gage pressure (consult tables) .....
9. Water actually evaporated (Item 7 × moisture in steam, which is usually between 2 and 4%).....lbs.
10. Total equivalent evaporation from and at 212 degrees (Item 9 × Item 8).....lbs.
11. Equivalent evaporation per hour from and at 212 degrees (Item 10 divided by time of duration of test) .....lbs.

Average Pressures.

12. Steam pressure gauge lbs. per square inch.....lbs.
13. Temperature of feed water entering boiler.....deg.

Horsepower.

14. Horsepower developed (Item 11 divided by 34.5).
15. Builders rated horsepower (on boilers).

A BRIGHT STAR REMOVED.

New York, July 12, 1922.

Editor Ice Cream Review:

It is with a deep feeling of sorrow and regret that we announce the loss of Mr. T. S. Maconkay, who, for several years, had charge of our department of editorial work and illustration. He passed away suddenly at 3:30 o'clock, Monday, July 10th, while writing copy at his desk in the office.

We desire to express to those of our business friends, who knew Mr. Maconkay, our estimation of his services and ability, which we feel have been recognized also by those whom he has served through us. Always conscientious and loyal, we sincerely appreciate the loss of a sincere friend and business associate.

Respectfully,
THE BURDICK-GARRISON CO., INC.,

NORTH REPEATING.

A couple of days ago a prominent "Flyer," one of the ex-officers of this peppy bunch, was stopping at a big Atlanta hotel. As he was enjoying the comfortable sense of well-being that follows a good dinner and a fat Perfecto, strolling through the lobby looking for a place to read the evening paper, he heard an excited voice, evidently belonging to an elderly woman, emanating from somewhere in the corridors, exclaim in a tone which indicated the height of huffiness, "I tell you, I won't have this room. I ain't going to pay my money for a place that isn't big enough to swing a cat, and, as for sleeping in one of them folding beds, I simply won't do it!"

The long-suffering boy she was addressing could stand it no longer.

"Get in mum," he said, in a weary voice. "This ain't your room, it's the elevator."

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

INSPIRATION FOR SALESMEN.

The Little Black Hen.

Said the little red rooster, "Gosh all hemlock, things are tough!
Seems that worms are getting scarcer, and I cannot find enough.
What's become of all those fat ones is a mystery to me;
There were thousands through that rainy spell—but now, where can they be?"

The old black hen that heard him didn't grumble or complain—
She had gone through lots of dry spells, she had lived through floods of rain.
So she flew up on the grindstone, and she gave her claws a whet,
As she said, "I've never seen the time there weren't worms to get."

She picked a new and undug spot—the earth was hard and firm;
The little rooster jeered, "New ground—that's no place for a worm!"
The old black hen just spread her feet, she dug both fast and free—
"I must go to the worms," she said, "the worms won't come to me."

The rooster vainly spent his day, through habit, by the ways
Where fat round worms had passed in squads back in the rainy days.
When nightfall found him supperless, he growled, in accents rough,
"I'm hungry as a fowl can be—conditions sure are tough."

He turned, then, to the old black hen, and said, "It's worse with you,
For you're not only hungry, but you must be tired, too.
I rested while I watched for worms, so I feel pretty perk.
But how are you—without worms, too—and after all that work!"

The old black hen hopped to her perch and dropped her eyes to sleep,
And murmured, in a drowsy tone, "Young man, hear this and weep:
I'm full of worms, and happy, for I've dined both long and well;
The worms are there as always—**but I had to dig like hell.**"

Oh, here and there red roosters still are holding sales positions;
They cannot do much business now, because of poor conditions.
But soon as things get set again they'll sell a hundred firms—
Meanwhile, the old black hens are out and gobbling up the worms.

"DYNAMO."

DIXIE FLIERS.

Supper Time.

I like to eat in the morning,
I enjoy my snack at noon;
But the end of the day—oh, boy; I'll say,
Is the time for a fork and spoon.
For the meal I think's the winner
Is the subject of my rhyme—
The highbrows call it "dinner,"
But to me it's "supper time."

After a day's hard toiling
Outside in the cold and wet,
When the fall of night makes my appetite
As healthy as it can get,
Oh, the joy that comes to meet me
As I open my own nall door;
The heavenly smells that greet me,
Makes life worth while once more!

A king has a throne to sit on
While he nibbles his costly fare,
But I give him the laugh—he doesn't know half
Of the joy of my old armchair,
Where I sit as long as I'm able
In comfort that's half sublime,
With my legs stretched under the table
When it's good old supper time!

"STABILIZER" OR "FILLER."

By Benjamin Masurovsky, Graduate Assistant, Dairy Department, University of Nebraska.

There are several sound reasons for eliminating the term "filler" when speaking of an ice cream mix and its composition. To begin with, the only possible filler used in an ice cream mix is water, and whenever the mix is prepared without the addition of water no filler, whatsoever, is introduced into the ice cream mix. This can be made plainer if we consider the term "filler" as used in the preparation of mixtures of a different nature than ice cream mixes. In the case of a fertilizer mix, the filler which is either ordinary soil or peat is added in such quantities as is required to balance up the bulk. For example:: when a ton of fertilizer is to be prepared according to a given formula, say 2-8-6; i. e. a mixture containing 2 per cent nitrogen, 8 per cent phosphoric acid and 6 per cent potash and if the required chemical composition is fulfilled by 266 pounds of nitrate of soda; 1144 pounds of acid phosphate and 240 pounds of muriate of potash, making a total of 1650 pounds the remaining 350 pounds are placed as filler thus making up the required bulk of one ton.

Similarly, in preparing a certain feed mixture, finely chopped straw or other highly cellulose substance is used as a filler to insure the bulk without affecting the required percentage of protein, carbohydrates and fats.

In preparing tablets of a certain drug the term "filler" is applied to the substance used as a dilutent which enables the pharmacist to obtain the desired strength of drug expressed in percentage. For instance, in the case of aspirin tablets if they are to contain 20 per cent of the active drug, 80 per cent of corn starch or other similar inert dilutent is added as a filler.

In the preparation of an ice cream mix, however, the term "filler" is being displaced by a more appropriate term, viz., "stabilizer" because this additional material does not serve as a balance for bringing about the desired quantity of a given ice cream mix nor is it used as a dilutent but its addition is made primarily to improve or facilitate improvement of the ice cream mix by stabil-

A canvas pail for carrying ice cream is the product izing it. The "stabilizer" as used in ice cream making, functions as an agent by virtue of which a desired condition of the ice cream mix may be secured and maintained for a considerable length of time.

Bearing in mind the lact that ice cream is a dairy product, it is not appropriate to use the word "filler" for, in the case of milk and butter we object to the filled milk and butter, why tolerate the term "filler" in such a dairy product as ice cream. For this reason alone the term "filler" used indeterminably in connection with the preparation of the ice cream mix should be replaced by a more descriptive term, "stabilizer."

NEW PACKAGING MACHINE.

A new packaging machine is on the market making its bid for favor among ice cream manufacturers. It is the Valerius Carton Filler, manufactured and sold by the Davis-Watkins Dairymen's Mfg. Co., Chicago, Illinois. If interested write for details.

Does your business pay? If not, why keep it? Advertise it For Sale in The Ice Cream Review Want Department. Some one may be glad to buy it if they only knew it was for sale.

THE SECRETARY OF THE PACIFIC ICE CREAM MANUFACTURERS' ASSOCIATION PAYS HIS COMPLIMENTS TO "DR." McCANN.

Tacoma, Wash., July 13th, 1922.

Editor Ice Cream Review:

In the July issue of Physical Culture or Torture, which ever way you look at it, there is an article written by one A. W. McCann, who for years has posed as a self appointed authority on foods, drugs, cattle and about everything known.

This article, with the Editor's note, appears to us as about the last word in a line of vicious attacks on reputable manufacturers in the various articles used for human consumption. You no doubt have taken notice of this, and in our opinion it deserves the criticism of every man in the ice cream industry.

Another article appears in the New York Globe and Advertiser of June 1st written by the same man advising the "whole world", and the people of New York and New Jersey in particular, that at last a real ice cream is being made. He knows it is because he was called to build it, consequently he admits such a thing is possible and is made only by the Keystone Ice Cream Co. of Hoboken and little old "Ny Yawk."

It's about time the reputable manufacturers of the country were protected from attacks by this class of so-called writers who try to impress their ideas on the public. You can always get followers for any fool idea and to allow the impression to go out that all the men in the ice cream business are crooks feeding poison to the people does not sit well with us at least.

The Editor evidently believes the prattle this bird spills along these lines as he advises his readers of what happened to Quaker Oats and says, "There is a fortune for some man who will make pure ice cream and advertise it." In our humble opinion if the trash he foists on the public came anywhere near being as pure as the average ice cream product there would be nothing to worry about. They censor moving pictures, etc., why not try a little of it on the publishers of this class of destructive articles. Glance through the pages and see the ads for Prof. Bunk's "Book on Manhood and Marriage," "How to Change Your Complexion in Thirty Minutes," "What's the Matter with Your Prostate Gland," etc.

Believe you will agree that anyone who viciously attacks the Ice Cream industry of the U. S. is attempting to fill a big order. Will be glad to get your views. Possibly we are a little peevish about it, but when men work 365 days a year to build up a business we don't like to have such things happen.

Yours very truly,
BERT H. WALKER.

Ice Cream Overrun Scale

Eliminates Guesswork and Insures a Uniform Product

Accurate *Durable*

Rapid *Simple*

No. 4600

Graduated dial gives direct readings in percentage of overrun. Determinations speedily made and with great precision. No calculations necessary. No weights required. No cost to operate. No special skill required. Uses only about two oz. of frozen cream.

Designed at the suggestion of the U. S. Dept. of Agriculture. (Dairy Division) and supplied to U. S. Government and prominent ice cream plants for the rapid and accurate determination of overrun or inflation of ice cream.

Container on the left is filled with unfrozen mixture—container on the right with frozen ice cream; the dial pointer moved until scale balances. The percentage of overrun read directly from dial, reading from 0% to 140%.

The two 4 inch weight plates permit the scale to be used for the ordinary weighing of any commodity up to 2 lb. (1 kg.) when weights are used.

Price, complete with 3 containers.....**$50.00**

National Association of Ice Cream Manufacturers

Extract from Report of Proceedings of the Twenty-first Annual Convention Held in the Hotel Radisson, Minneapolis, Minn., October 10, 1921.

(Continued from July issue)

October 12, 1921, Morning Session.

The meeting convened at nine-ten o'clock A. M., President Martin presiding.

President Martin: Mr. Morris, will you report on that Tax Revision Committee?

Mr. Morris read the report of the Committee on Tax Revision as follows:

"Shortly after its appointment the Committee held a meeting in New York City and discussed the several taxation proposals which were then being given publicity. The Committee was of the opinion that we would be in a better position if we should watch tax proposals from the outside and be ready, if any proposals peculiarly harmful to our industry appeared, to oppose them, rather than to become conspicuous in a constantly shifting discussion of a semi-political nature where a prominent appearance might make us a target for attack in the shape of taxation. The Committee favored unqualifiedly the repeal of the excess profits taxes and of the special excise tax on soda and ice cream sales and favored in a general way the substitution of some form of general sales tax. At that time the question of the sales tax was being discussed from so many angles by economists and publicists that no member of the Committee was inclined to tie their attitude of general approval down strictly to any one of the many forms suggested.

"The Committee decided to adjourn subject to the call of the Chairman and to keep close watch from the outside over taxation measures. If the situation should at any time become acute, the Chairman was expected to call a meeting on short notice.

"Aside from the fact that the Committee members have kept in constant touch with the developments of Federal Taxation, there has been no further activity as a Committee."

President Martin: What is your pleasure with the report?

Mr. A. G. Hoefler (Buffalo): I moved it be received and filed.

The motion was seconded and carried.

President Martin: Mr. Nivling, you are on the Cost Accounting Committee. Have you anything to report?

Mr. Nivling read the report of the Committee on Cost Accounting as follows:

"Your Cost Accounting Committee was appointed in April of this year. On account of the close proximity to the summer season we were unable to hold any meetings, and in fact the Committee feel that their work can best be described as inactive.

"Such inquiries as are common regarding the Cost Accounting system have been answered, and many inquiries as to the Cost Accounting forms have been replied to with the suggestion that if the inquirer was not a member of the National Association they were advised to join, because they could secure the Cost Accounting forms at a nominal figure through the Secretary's office.

"In a recent issue of the United States Chamber of Commerce Bulletin on Cost Accounting is the following: 'Nothing in this world is perfect; some waste of time, or money, or material, occurs in every transaction. To discover the causes of waste; to point them out; and to contribute in every way possible toward reducing them is the aim of every accurate form of Cost Accounting.'

"It is almost inconceivable that any business, large or small, can be conducted well unless true costs are known. Each manufacturer should know WHAT is taking place WHILE it is taking place. This means that executives should have daily statements and records, also weekly and monthly statements and records, to compare with previous experiences in his own plant so that he knows promptly any increases in his costs. These figures should show him when some of his expenses are too high; they should enable him to determine any leaks which are occurring, and when his costs are increasing in a department he should see whether the selling prices of his product justify these increased costs.

"Your business is the most important thing in the world to you. If other business men find these facts necessary—that is, I mean, the facts relative to costs, should you not provide yourself with daily, weekly and monthly statements? Many of our manufacturers are doing this. All of our members should know what is occurring day by day in their business. By having these statements coming to your desk you can conduct your business in an intelligent manner. You will know what you are doing as compared with guessing, which you recognize as not business-like.

"The more exact; the more progressive; the more thorough your Cost Accounting records and statements are the more everyone will he helped, from and including the producer to the consumer.

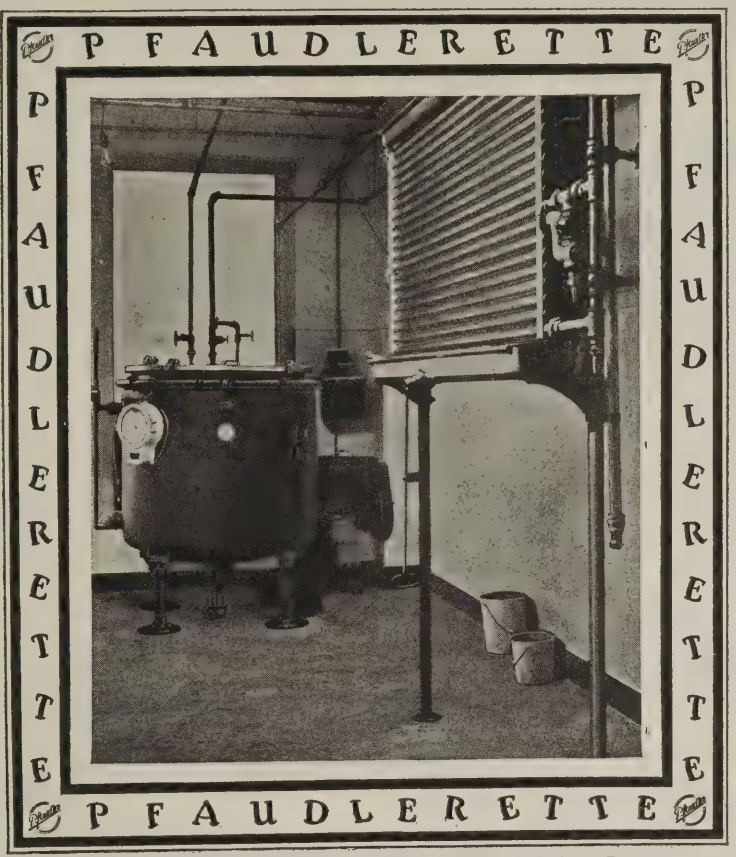
"It is your Committee's thought that each one of our members should install every possible labor saving device that will keep him in touch with the details of his business. We urge each member to know his costs, and assist his competitor to know his. Enlightened competition is a benefit to both the producer and the consumer.

"The Federal Trade Commission in a letter to the United State Chamber of Commerce on this subject says: 'For a Trade Association to set up and induce the use by its members of a scientific and accurate plan of Cost Accounting is not only legal but highly beneficial to the individual members of the Association.'

"The United States Chamber of Commerce also urges Trade Associations to develop such systems for the benefit of members.

"How far our members are using Cost Accounting systems your Committee is unable to determine, but it is fair to assume that all the larger manufacturers have adopted Cost Accounting systems. The sale of Cost Accounting forms as adopted by this Association has been very gratifying, and it is hoped that members have not only purchased these forms but are using them."

President Martin: Mr. Nivling tried to hold an alibi that his Committee wasn't appointed until Spring. They did a lot of work after they were appointed, however, and I want to say to those who are not familiar with the matter, that the Cost Accounting Committee has perfected a very complete form of records of uniform accounting. Those forms can be secured through the Secretary's office at any time. What are they a set?



Secretary Loewenstein: Three dollars and fifty cents. That is the cost of the forms.

President Martin: If there are any who have not availed themselves of that opportunity they should take advantage of it, because it is a splendid thing and you will be benefiting very materially by doing it.

Prosperity follows the dairy cow.

Be sure you attend the National Dairy Exposition, October 7th - 14th, St. Paul - Minneapolis. Our booths Nos. 99, 100, 101.

Pfaudlerette, Milk Pasteurizer, Sibley, Lindsay & Curr Co., Rochester N. Y.—Handling about 125 gallons daily.

Prosperity also follows users of Pfaudler Equipment

Read below how Mr. Baker tripled the output of his plant through the use of the Pfaudlerette.

TRIPLES FORMER CAPACITY

Sibley, Lindsay and Curr Co., is one of Rochester's largest department stores. In conjunction with the store are operated a restaurant, bakery, and cafeteria. Mr. Baker is the man in charge of the dairy supplying milk to these three outlets, handling about 125 gallons daily. Let him tell you what the Pfaudlerette has done for his business:

"We have been using your Pfaudlerette for some time. In fairness to you we must state that the results far exceeded our expectations. *The flavor of our milk has been greatly improved and we are at present selling triple our former capacity, which fact I can attribute only to the improved flavor and quality in our pasteurized milk.* The glass lined tank is certainly valuable in this respect. We can heat in fifteen minutes, and our bacterial counts, from ordinary holding periods are exceedingly low."

SIBLEY, LINDSAY & CURR CO.
Per E. C. Baker, Mgr.

There is really only one sure way of increasing your business, and that is by improving the quality of the products you sell. The Pfaudlerette will do this for you. Mail the coupon for free explanatory booklet.

What is your pleasure with the report of this Committee?

Mr. Horn: I move it be received and filed.

The motion was seconded and carried.

President Martin: Our next number is "The Express Situation," by Mr. F. D. Jones, of Davies and Jones, Washington D. C.

* * *

The Express Situation by F. D. Jones.

Mr. Chairman, Ladies and Gentlemen: I can see that you are endeavoring to crowd your program through this forenoon, so I will cut my speech just as much as I possibly can and still get the facts to you.

The tremendous increase in transportation rates during the past two or three years have tremendously emphasized the importance of transportation as an element in cost. Manufacturers have come to realize that, even though their competitor gets the same rate, an excessive rate can very seriously curtail business, and the public has learned that practical increases in freight rates are naturally passed on to the consumer.

The far greater importance of freight rates and passenger rates so far as the economic and social welfare of the country is concerned has focused the attention of the entire nation upon them and unfortunately in this situation the express situation has been almost entirely ignored so far as the general public is concerned.

Back in 1918 when the railroads went under the control of the Director General of Railroads, the Director General refused to make contracts with the four big express companies, rather to approve the contracts they then had with the railroads. He stated to the express companies, that, if they would consolidate into one company and thereby secure the many economies of unification, he would enter into a contract with them.

As a result the four great express companies—there were really seven, counting the subsidiary companies—merged into the American Railway Express Company with a capitalization of about $34,500,000. The Director General then entered into contract with them. At the time of expiration of federal control the express companies procured the insertion in the Transportation Act of 1920 of a provision authorizing the Interstate Commerce Commission to approve and authorize the permanent consolidation of the express companies, i they felt this would result in economy of operation an would not unduly restrain competition. The Interstat Commerce Commission in 1920 authorized this perman ent consolidation into the one company. As you wel know, while the unification of the express companie may have resulted in substantial economies (the expres companies themselves claim that the unification resulte in economies of approximately $13,000,000 per annum yet, because of war and other conditions, there was a almost complete breakdown in the express service. Th Government was using for war purposes a considerabl part of the equipment which is naturally used for ex press shipments. The personnel of the express company was broken down, both through the higher wages offere in war industries and because of the draft. These an other conditions brought about a complete breakdow in express service.

Typifying that situation, the loss and damage claim of the express company jumped from approximately $3,000,000 in 1915 to over $22,000,000 in 1918. That $22, 000,000 represented about nine per cent of the entir express charges. This situation developed until the ex press company was faced with very grave losess an in 1920 they filed a complaint before the Interstate Com merce Commission asking for a twenty-five per cent in crease in rates. This Association opposed that increase feeling that it was unfair to expect the express shippe to bear the entire loss of the inefficincy of the carrier regardless of what was the cause of that inefficiency and, secondly, because we felt it was grossly unfair t expect the ice cream industry to pay the burden of th terrifically heavy loss and damage claims which resulte from the movement of commodities such as milk, etc. when the loss and damage claims in the ice cream industry were relatively insignificant.

As you know, in cooperation with the various othe associations, we succeeded in holding down that increase to 12.5 per cent. Immediately thereafter the War Labo Board, by two decisions, increased the wages of the express company's employes sixteen cents per hour, forcing upon the company increased costs of about $30,000, 000 per annum, and it forthwith filed with the Commission a complaint asking for a further increase. The Association felt it could not consistently oppose an increas to cover that item and a further increase of 13.5 per cent was granted by the Commission. At the same time the company filed its complaint for a twenty-five per cent increase. It also filed a petition asking for a number of amendments to the official express classification. Two of those amendments were of extreme importance to the ice cream industry. The first increased the estimated weight of ice cream from 100 pounds to 115 pounds and the second increased the weight on the return of empties from sixteen to twenty cents on five gallon containers and from twenty-seven cents to thirty-five cents on containers over five gallons. We also opposed those changes very vigorously, hearings, as you gentlemen probably know, being held all over the country. We succeeded in defeating the increase in the rate on return of empties but were unsuccessful in our attempt to hold down the estimated weight.

Then in the summer of 1920 the express company and the American Association of Railway Executives submitted to the Interstate Commerce Commission a form of contract to supplant the contract which had expired between the railroads and the express company. This contract was finally entered into, provided that out of all revenues received the express company should first pay all its operating expenses; then out of the remainder, two and one-half per cent, which was supposed to guarantee the express company a minimum of six per

GUMPERT'S *Ice Cream Improver*

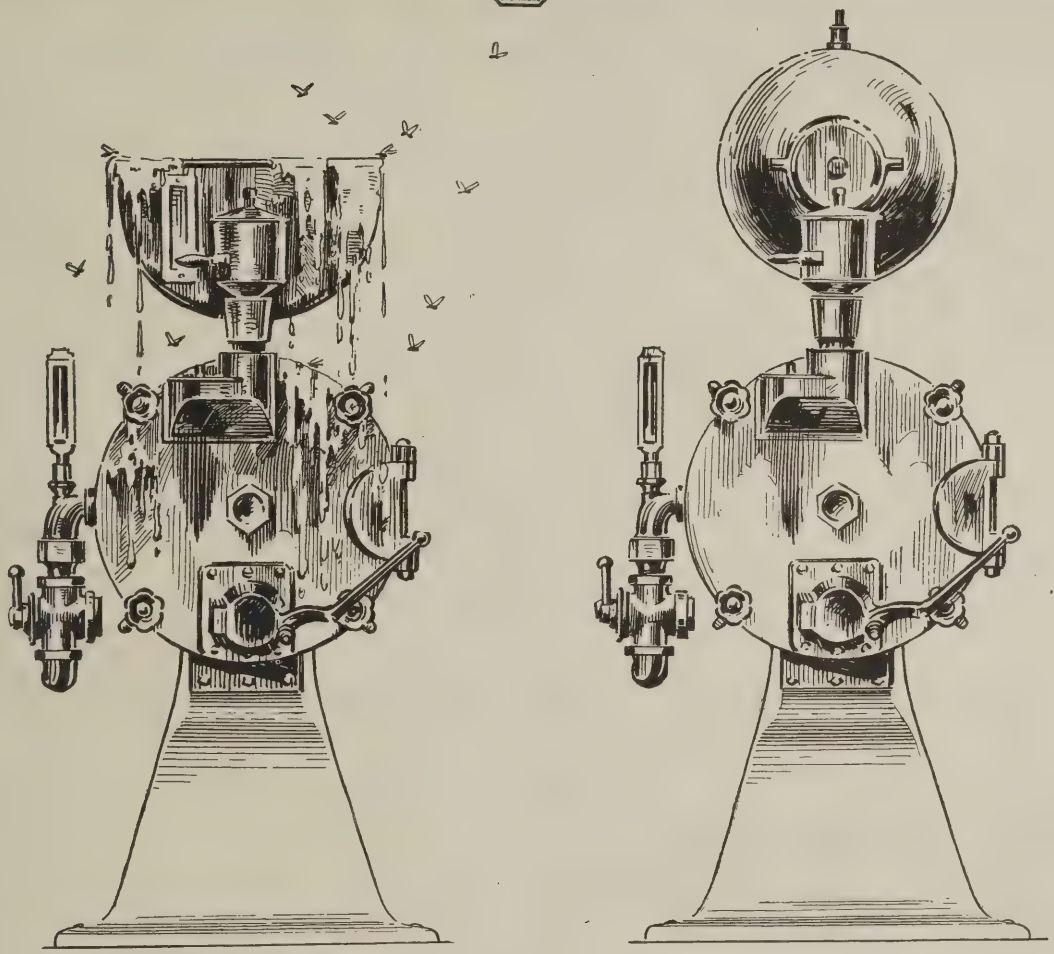
PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—St. Paul-Minneapolis, Oct. 7-14.

cent on the total valuation of its property used in the express business should be reserved to the express company, balance to go to the railroads. This as you see is sort of a cost plus contract. Previous to that time the revenues had been split fifty-fifty between the express companies and the carrier. The results of this contract have not been entirely satisfactory to the railroads. The best information I can get is that the Eastern railroads who used to receive fifty per cent are now receiving only twenty-seven per cent of the revenue, while the mid-western carriers are receiving about forty and the Mountain Pacific carriers are receiving fifty-three per cent, which is better than ever. The reason assigned for the losses being forced upon the railroads is that the business in the Eastern manufacturing districts is so heavily short haul business and the terminal expenses are so high as to make the operating expenses of the express company very high, and consequently, the railroads are not receiving a satisfactory return, they claim.

On top of that, several months ago an Eastern manufacturer of a patented refrigerator container filed complaint with the Commission that his company was being unduly prejudiced by the estimated weight granted on ice cream moving in the regular tub containers. In view of the fact that the hearings had been held all over the country and the 115 pound weight had been just established by the Commission, the officers of the Association naturally felt that there was not the slightest danger of the 115 weight being increased. Under the new Transportation Act of 1920, however, the Commission has the power not only to fix the maximum beyond which a rate shall not go, but also to prescribe minimums, and on a very incomplete record the examine in this case held that there was an undue prejudic and that it should be removed by increasing the weigh on the regular tub containers to 140 pounds whic would have represented actual weight and practicall effect a rate increase of about thirty pounds. Despit the fact that the examiner's report had already bee entered, after some work the Association succeede in intervening in that case and after filing briefs an arguments and so on, we won. That case has done tw things of great importance to the ice cream industry First, of course, it saved the industry from a possibl thirty per cent increase in rates. Secondly, it established the principle that a patented dry refrigerator containe was entitled to a deduction of twenty-five per cent fro its gross weight because of the refrigeration; and i some practical dry container is invented, or there is on now in existence, that promises to be of tremendou importance to the industry in the future so far as sav ing of transportation costs are concerned.

That covers what has happened in the past two years in the express situation. They have forced upon the industry a rate increase of approximately forty per cent The Association, on the other hand, has successfully combated and defeated proposed increases of approximately fifty per cent.

Now with reference to the present situation: You have no doubt noted throughout the country that there is an insistent demand for the reduction of freight rates. All the shippers' organizations that move their commodities by freight have organized, and particularly through the National Industrial Traffic League, and have put great pressure to bear upon the carriers to reduce rates as a prerequisite of the re-establishment of some industrial condition. The attitude of the carriers up to the past several weeks has been bitterly hostile to any reduction. The attitude of the Interstate Commerce Commission, under the leadership of Chairman Clark, who is the author of the Transportation Act, in the main, of 1920, seemed to be also hostile to any substantial reduction. I saw at least one letter of Chairman Clark in which he resented very bitterly any suggestion on the part of the President or the Secretary of Commerce that rates should be reduced, stating that the Commission was an entirely independent body, responsible only to Congress. President Harding, however, evidently did not feel exactly that way about it and about six or eight weeks ago called upon the Commission in person, suggesting that as he had the power to make suggestions and recommendations to Congress, he assumed it was entirely proper for him also to make recommendations to the Interstate Commerce Commission.



The action of the President, combined with the insistence of shippers' organizations all over the country, has brought about a great change in the situation. Chairman Clark of the Interstate Commerce Commission has also resigned and it is the uniform belief among newspaper men in Washington who are very closely in touch with the situation that there is going to be a substantial reduction in freight rates in the immediate future.

I wrote the express company a week or two ago merely to get their attitude with reference to a reduction in express rates. It seems to me that every reason which applis for the reduction of a freight rate applies with equal force to the reduction of an express rate to industries such as ours which are largely dependent upon express for the distribution of the commodity. I received this letter, however, from Mr. Elliott, the Vice-President. I will just read the pertinent paragraph.

"There is a general feeling among shippers of all

A STURDY ICE MACHINE WILL STAND UP UNDER THE HARDEST SERVICE.

kinds of commodities that there should be a reduction in transportation charges and we learn that many shippers' associations have been looking for the express company to make some reduction in rates. It is quite impossible to give any consideration to reducing the rate on any commodity by express at this time, because the very high wage paid to employes under orders of the Federal Labor Board has so greatly reduced the amount of the transportation charges actually accruing to the railroad that there is not sufficient left to pay the actual cost of moving express trains.

"It is not unlikely that the railroads will demand a greater revenue from the transportation of express traffic in order to more nearly meet the cost of moving the business.

"I trust that under these circumstances you may conclude that the time is not opportune for asking a reduction in rates on ice cream."

I do not entirely agree with Mr. Elliott's letter. There are some very sound reasons, entirely aside from the general depressed industrial conditions, which are causing the railroad carriers to reduce rates and which should move the express company to reduce rates. In the first place, the express rate increase of 13.5 per cent was granted solely to meet the increase of sixteen cents per hour granted by the War Labor Board on express company employes' wages. Effective August 1st of this year, the War Labor Board reduced the wages of the employes six cents per hour, which meant a reduction of about $8,000,000 a year to the express company, and on the basis of increase granted would of itself warrant us to at least three and a half per cent rate decrease.

Then on top of that there has been a tremendous reduction in loss and damage claims. The situation ran up to $22,000,000 was simply inexcusable on the part of the express company and resulted from the elimination on their part of any check-up system. They have now reduced these loss and damage claims so that in prevailing in 1918, when the loss and damage claims June of this year the reduction over June of last year was sixty-five per cent. In other words, the total number of claims was reduced from over 160,000 to a little less than 60,000. It would seem to me that, where the loss and damage claims under abnormal conditions represented nine per cent of the cost or nine per cent of the total express revenue, when they reduced thier loss and damage claims to such a great extent they would be in a position to reduce their charges for transportation in some substantial way.

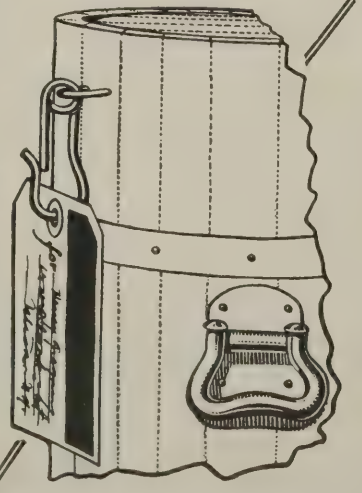
Furthermore, there is no doubt in the world that the material cost, the cost for automobiles, equipment, etc., of the express company has been greatly reduced over what it was two years ago. The railroads are asserted to have reduced their costs of operation by robbing express cars on regular. scheduled passenger trains Two Eastern railroads have each claimed that they have saved $2,000,000 each per annum by that one thing.

In addition it seems to me that the capitalization of the express company would warrant very careful investigation. The determination of what should be the captilization of the consolidated express company was arrived at merely as a matter of trade with the Director General and no valuation was ever fixed by the government, and the result is that we may be paying express rates which are in the long run based back upon the capitalization of the company when that captilization is considerably over inflated.

Then there is another factor from a purely transportation standpoint which would warrant a consideration of reductions, and that is the growing competition of trucks.

Now, merely to summarize the situation and then I shall have finished. As a result of these past several years, the ice cream industry and every other industry shipping by express is faced with an absolute monoply of express transportation. That would naturally tend ultimately toward deteriorated service, higher costs and so on, but I think from what I can gather that it must fairly be said that the express company the past year has been making earnest efforts to improve its service and has made improvements which have been substantial. They are arranging to extend the time for the filing of loss and damage claims to six months. They have been holding conferences among their employes all over the country to train them into a knowledge of tariffs, proper treatment of patrons, etc. They have been holding conferences of their motor equipment people with the idea of eliminating unnecessary waste in the handling of the motor service, which is the most expensive part of the express service. They have tremendously reduced the loss and damage claims. They are installing what is rported to be very efficient motor and trailer service in the large cities, such as Chicago, for their transfer business, and as I understand it, though I have no facts on this, their pick-up and delivery service has improved.

Then, secondly, we are faced with this express company contract which is in practical effect a cost plus contract, and which holds all the dangers that a cost plus contract has in the way of inflated cost, and unless this situation is very carefully watched it will tend to increase or maintain a high level of express rates.



Then, third, this industry is faced with an abnormally high level of rates—forty per cent increase in the past two years. In the face of reduced labor costs to the express company, reduced material cost, greatly re-

TAG HOOKS

duced loss and damage cost, and the other factors which I have mentioned, it would seem to me that would warrant a reduction.

Then, finally, I think this Association should consider whether it is practicable to work out a limitation which might be imposed upon the class of commodities which can move by express. Just several months ago the express company was advertising the fact that it had successfully moved elephants by express, which seems to me going far beyond the proper function of an express company.

Now a good many of the other industries are taking this matter up with the express company and advise me they are intending to file complaint before the Commission if they cannot get results from the express company. The attorney for the packing industry has been in touch with me several times in the past two or three months, and various other industries are equally interested.

To conclude, it seems to me that there is not a single reason which would apply to the reduction of passenger and freight rates, particularly freight rates, which would not apply to the reduction of express rates, and there are many additional reasons which argue for the reduction of express rates. Moreover, the express company is in a vastly different position than it was a year ago or two. The express company has been declaring dividends for the past four quarters at the rate of six per cent, even under the present depressed financial conditions. The one rate increase in August, 1920, jumped the revenues of the express company $8,000,000 in a single month, and I am sure that there cannot be the slightest doubt that as soon as there is any substantial revival of business on the present rates the express company will be receiving an excessive rate and receiving an excessive return on its capital investment.

Thank you.

President Martin: I am sure we have all enjoyed the message brought to us by Mr. Jones and I want to extend to him the thanks of our Association for the information he has conveyed to us.

In regard to this express situation, I have had considerable to do with express companies in the past and have some knowledge of their business. Mr. Elliott, the Vice-President of the American Railway Express has been a personal friend of mine for thirty years or more, and as I said in my message on Monday, I feel that we can accomplish something by going to Mr. Elliott with a strong committee, after we have compiled accurate data for him showing the loss that we have had in our shipping business, due to the excessive express rates. I feel that he is enough of a business man to see daylight and grant us some relief, and we certainly need it.

Our Secretary wants to call your attention to a ruling of the Interstate Commerce Commission which might affect our industry.

Secretary Loewenstein: Sometime ago the American Railway Express Company petitioned the Interstate Commerce Commission for an increase in the estimated billing weights of kale, lettuce and spinach from Southern points shipped with ice as a preservative. The matter was finally decided by the Interstate Commerce Commission on May 14th. It appears that the billing weight of a bushel of spinach, dried or with ice, was twenty pounds. The express companies petitioned to have the estimated weights advanced so that a three bushel barrel, which was being shipped at sixty pounds, could be raised to ninety-five pounds; a four bushel barrel from eighty pounds to 125 pounds; and a five bushel barrel, or four and one-half, from ninety pounds to 140 pounds.

From the record it appears that the average weight was thirty-three pounds for a bushel of spinach. The Commission decided in that case as follows:

"Estimated weights are commonly used for the conveniences of both the shipper and the carrier, and they should preferably bear some close relation to the actual weights. While the weights proposed are more nearly in harmony with the actual weights than those now maintained, the latter have been in effect since the inception of the industry and the rates have been made with rlation hereto. In a case of this kind, where the practical and only effect of the proposed increases in estimated weights would be a substantial increase in transportation charges, the respondent should show not only that the proposed estimated weights are not excessive, but also that the application of the existing rates to such estimated weights will not result in unreasonable transportation charges to the shipper. This has not been done. We accordingly find that the proposed increase have not been justified, and an order will be entered requiring the cancellation of the suspended schedules."

Now there is a case that bears a very close relationship to the shipment of ice cream by express under estimated billing weight where ice is used as a preservative. The Interstate Commerce Commission you will notice states that the rates have been in effect, since the inception of the industry, which is true on the hundred pound estimated weight of five gallons of ice cream, and the increase in the estimated weights would be equivalent to an advance in the transportation charges. That was also true when the advance in the billing weight was made from 100 to 115 pounds. It did increase the transportation charges on ice cream shipments. They furthermore state that inasmuch as those estimated weights would result in an unreasonable transportation

charge to the shipper, they should not be allowed. Now, from the records in that case, the Western Weighing and Inspection Bureau found that the average weight of a bushel of spinach shipped with ice was thirty-three pounds, and the express company asked that the billing weight be increased from twenty pounds to twenty-five pounds, an advance of twenty-five per cent. Now then they ask for an advance of fifteen per cent on ice cream shipments.

The actual weight of spinach is thirty-three pounds to the bushel, as against an estimated weight of twenty pounds to a bushel. The billing weight of a hundred pounds of spinach would be five bushels of spinach. That would be an actual shipment weight, according to these estimates, of five times thirty-three pounds, or 165 pounds. The records showed, in the cases at Washington which Mr. Jones handled, that the average weight of a five gallon packer of ice cream shipped by express, in which ice was used as a preservative, was 144 and one half pounds. Therefore, the Commission found that 165 pounds of spinach could be shipped for 100 pounds but 144 pounds of ice cream couldn't be shipped at a hundred pounds but should be billed on a basis of 115 pounds. I have had the matter up with Mr. Jones before and I merely mention these facts to create some discussion in regard to the matter. It is very serious to the ice cream manufacturers. Any number of them with whom I have talked tell me that their shipping business has been practically ruined.

I was present at the rate case that came up here in Minnesota and the evidence of every one of the ice cream manufacturers was that their shipping business had been cut down in some instances to as low as twenty-five per cent. They were selling their ice cream at a lower figure, so that it wasn't the price of ice cream which was the factor, but it must have been the excessive transportation charges. It was shown in the record that locally their ice cream was being sold at the same or a higher price than it was bringing in the country, and their business had increased in the cities, where they were doing a local business with no transportation charges added, whereas in the country their business was absolutely gone.

I think this is something that the Association should take recognition of, and should take some action. It is possible, Mr. Jones, in view of the decision of the Interstate Commerce Commission in the kale and spinach case, which seems to bear a very close relationship to the ice cream case, and in view of the ruling of the Commission, that there might be some prospects of re-opening the classification case.

President Martin: The Secretary has shown some additional light in reference to this spinach case and I am sure that we can accomplish something through the express companies.

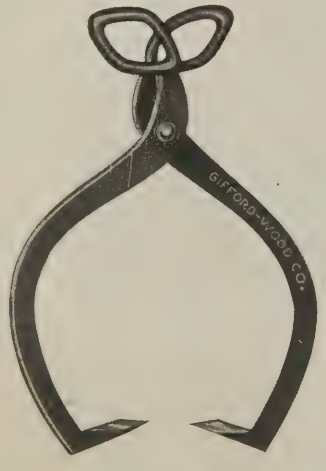
We will now hear from Mr. M. D. Munn.

* * *

The Relation of the National Dairy Council to the Ice Cream Industry, by M. D. Munn.

The title assigned to me on the program is rather accurately descriptive, "The Relation of the National Dairy Council to the Ice Cream Industry." The real thing in my mind is, what is the relation of the ice cream industry to the National Dairy Council? I think you men haven't yet realized what your branch of the industry is, and I want to talk about that for two or three minutes.

Do you know what your business amounted to in this country, if the government figures are correct, during 1920? There were 260,000,000 gallons of ice cream consumed. I think that is low, unquestionably, but taking those figures as an illustration, 260,000,000 gallons of ice cream would be about 1,350,000,000 pounds of ice cream; assuming that machine run was five pounds to the gallon and batch run around six pounds to the gallon, dividing it would be about 1,050,000,000 pounds, or a little over ten and a quarter quarts per capita. One quart of ice cream will make about six medium sized plates of ice cream. That is, there was consumed during 1920, on the basis I have stated, about sixty medium dishes of ice cream per capita, or the people of this country had ice cream sixty days or two months out of the twelve months and there were ten months that they didn't have a taste of ice cream.



If your ice cream production ran up to 325,000,000 gallons, it would increase that amount fifteen days, or two and a half months, that they had one dish of ice cream a day and nine months and a half they didn't have a taste of ice cream.

There is no branch of this industry that has a greater opportunity to build itself than your branch. Are you doing what you should do to build your business and serve humanity?

Now the National Dairy Council is an organization through which you ought to be working. We spent last year out of the funds of the National Dairy Council upward of $18,000 in advocating ice cream as a food. We received in support from the ice cream industry less than one-third of that, and that entire support came from a few ice cream manufacturers in the city of Chicago and the state of Illinois.

Now you may say it is the fault of the National Dairy Council. Consider that it is part our fault. It is also your fault. The ice cream dealers of Illinois put on a remarkable exhibition down at Springfield last fall, we cooperating with them. The ice cream dealers of Chicago had a very fine display at the Pageant of Progress

in Chicago, we cooperating with them in some work, but that is the extent of the work done, excepting what we put out in our publicity with some publicity of this character.

I think I have consumed my fifteen minutes now. Dr. McCollum is here and I want to have him talk to you just a few moments. He will speak in the interest of dairy industry. In the meantime, I thank you for this gracious attention.

President Martin: Mr. Gardiner, who is Chairman of the Research Committee, has a report to make and it may have something to do with what Dr. McCollum is going to talk about.

Mr. Gardiner: Mr. Chairman and Gentlemen, this report is very brief. I will be ready to answer any questions as you may want different facts brought out clearer.

Your Committee on Research Laboratory begs to report as follows:

That a joint conference with a like committee of the International Milk Dealers was held in Washington, Feb. 24, 1921. The need and desirability of research work for our further information and for the benefit of the public was manifest to all present. A report of this meeting has been filed with your Secretary and sent out as a bulletin to your members.

A second joint conference was called for October 11, 1921, in order that a complete report might be prepared for your convention and for the coming convention of International Milk Dealers. Briefly the work of this conference has resulted as follows:

The name to be "American Dairy Research Institute."

That simple office requirements only are necessary.

That a director of the highest scientific attainments be selected.

That a Committee representing our Association by three members and the International Milk Dealers Association by three members would, with the director, take charge of the Institute.

That the three prime objects to be attained would be as follows:

1. A library of all dairy literature, including, of course, ice cream. We question whether the dairy literature of the world has ever been assembled. It must be a great mass when you figure all the publications concerning dairy matters in this country, and probably none of that of Switzerland, England, Germany, Holland, Denmark and probably Sweden has been collected, indexed, read by a scientific mind and made available for the industry. The importance is manifest.

2. Research work on commercial or plant problems. There are many matters that we in our own plants cannot work out and if we did they would fail to get the general publication necessary so that others might be benefited, and, again, a problem worked out and handled in a single, private plant might be discounted by other manufacturers for selfish or other reasons.

3. Fundamental research work on matters relating to public health conducted absolutely free from any possible taint of commercialism. I think Dr. McCollum or any scientific man would soon put you wise to so many of these problems that they could almost at once tell you, and your own judgment would show you, that the sum of money we are naming is not going to be large enough to accomplish anything like the results we wish.

Research work would be prosecuted through those scientific institutions best fitted and by scientists considered best acquainted with the subject matter of the research.

Instead of having large property, your own laboratory, and things of that kind, matters of fundamental research work would be worked out in those institutions of scientific learning where the very best results could be found and whose word would be generally accepted by all the scientists in the country.

The funds necessary should be $50,000.00 a year guaranteed for a period of five years; the two associations each taking their share of this budget.

We have not any thought of engaging a director from his avocation for a limited period. It should be at least a five year story and you could hardly be going strong before the end of the fifth year.

The manner of raising funds has not yet been fully determined and cannot be until passed upon by the proper body of the International Milk Dealers' Association. It may be by a small fraction of a cent per gallon with a sufficient gallonage to raise the necessary amount, or it may be by a straight and direct payment from the treasuries of the two associations.

It is to be regretted that this matter is not today in concrete form for action by this Convention and we respectfully suggest that if agreeable to the Convention, this matter be referred to the Executive Committee of the National Association of Ice Cream Manufacturers.

Now, gentlemen, this matter is one of the great things before this body. It is one of those things which when you approach it you must drop the little commercial idea, you must get on a broader, higher plane, you must realize that you have duties to yourselves, of course, but you also have a duty to your people. That is greater than almost any duty to yourself.

President Martin: I am sure that many of you do not appreciate the work that the Committee on Research Laboratory has done in the interest of our Association. Mr. Gardiner has been untiring in his efforts as Chairman of that Committee.

Mr. Gardiner: I move you, sir, that the report of this Committee be referred to the Executive Committee.

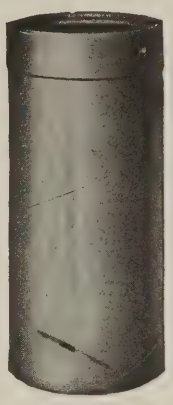
The motion was seconded and carried.

President Martin: I asked Mr. Gardiner to report at this time for I thought it would be well for Dr. McCollum to know that we are striving to do something that is really worth while for our industry, and I would like to ask you, Doctor, if you can give us any suggestions in regard to this work.

Dr. McCollum: I appreciate the opportunity to say a few words on that question. I am very much pleased with Mr. Gardiner's report; it has the right ring to it.

Now I would say that you have available the machinery for getting just the kind of research you want. During the war there was established in Washington, as most of you know, a National Research Council and this National Research Council is still in existence. There are a good many men, scientific men, who have a feeling that that institution was well worth trying to keep alive in peace-time. So many of them believed that and so cogent were their arguments that the Carnegie Foundation gave them a considerable sum of money to build a suitable building in Washington to serve as their headquarters and to take care of the overhead of that institution.

The National Research Council has the whole-hearted support of scores and scores of the ablest scientific men in this country in every field of science—in physics, chemistry, botany, agriculture, plant pathology and what not.



The National Research Council has committees and committees. There are committees of specialists in various fields—in engineering, physics, chemistry, plant pathology and various other lines.

If you want investigation of any kind carried out, take it to the National Research Council in Washington and you will get the best guidance possible. There are

TYPE B
Foot-Power Filler

Sealright—a Practical Filling Machine for the Round Container

The Sealright Filler, with the Sealright Containers, forms the finest combination on the market for speedy and thoroughly satisfactory work. The machine is compact and fits in anywhere. It automatically packs bulk ice cream in one or or more flavors without the necessity of the cream being touched by hands. Bulk cream in packages is what the people want. Be a leader in your community and win popular favor by supplying bulk cream in the Sealright Package.

Sealright Containers

appeal to the ice cream buyer, for their carrying and keeping qualities, and because they do away with the mussy, unsatisfactory method of unwrapping and slicing the usual brick. And more important still, they protect the dealer against loss by measuring the cream accurately—four quarts from every gallon, instead of the shortage that always results where bulging paper pails are used.

BARBER

IF you want to keep closely in touch with the latest developments in equipment and supplies for your business, you have only to keep your name on the Barber mailing list. As large distributors, we keep fully informed on new machinery and improvements brought out by the various manufacturers, and the things which are practical and worth-while are quickly passed along to our customers. This, with our Chicago and St. Paul locations, and our excellent shipping facilities, is a great convenience and valuable to the dairy industry throughout the Middle West.

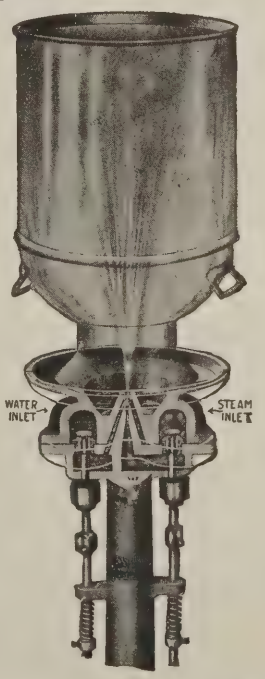
Danforth Jet Rinser and Sterilizer



A can steamer, to be satisfactory, must be fast—thorough—and convenient in operation.

The Danforth steam jet is located directly beneath the orifice. The action of the jet breaks the water into a fine spray and greatly accelerates its speed. The water is heated by the steam as it passes through the ejector.

Note the convenient operation of the valves directing the water and steam. A flexible foot tread, simply by moving the ball of the foot one inch to the right, shifts from water spray to live steam. The rinsing is instantly followed by sterilizing. Nothing could be speedier or more convenient. The hands of the operator are left free to hold the can.

It is low enough in price to make it practical for the smallest plant—large enough in capacity to meet the needs of the plant handling 300 cans per day. A thoroughly practical and dependable piece of equipment at a moderate cost.

Price, painted gray, $45; galvanized, $50

numerous investigators of high order, men who look with a keen vision, who have the ability to stand before a problem and reflect upon its intricacies and see a solution where surprisingly few individuals would ever do so. You have the opportunity through the National Research Council, if you want to furnish them with funds, to get that kind of advice and I would earnestly urge that you give heed to the suggestion which Mr. Gardiner has made. He has given a good deal of thought and attention to this subject.

I just mention these things in order that I may supplement in a way Mr. Gardiner's report and tell you that there is this movement by the National Research Council to assist any industry, but industry must finance its own investigation. Industry will have advantages in having its investigations carried out through this organization that it can gain in no other way.

I thank you.

President Martin. Doctor, we want to thank you again for the additional information.

Is Mr. Ed Sutton present? I understood he had a few remarks to make.

Mr. Sutton: It is a privilege and a pleasure to introduce to this Convention one of the younger men in our industry whom I have known since he was a child and who has come to a time now when he is taking some of the burdens off his father's shoulders.

It is good to feel that the work we have done can be taken up by younger hands who will do it probably more efficiently than we ever did, and give to the public perhaps a much better product than we have ever given them, and that the industry will continue to grow with leaps and bounds upon the foundation that the older men in the business have built. It gives me the great pleasure to introduce to you Allan D. Cunningham.

Mr. Allan D. Cunningham: I have prepared a short paper and I will just read it to you.

The Ice Cream Industry throughout the United States, by means of scientific methods of manufacture, is recognized by the public as selling a wholesome, healthful and pure product.

This recognition by the public is also due to their knowledge of the sanitary type of construction and materials in Ice Cream manufacturing buildings or plants.

By a sanitary type of construction and materials I mean materials that are non-absorbent, fire-resistive, non-wearing, non-deteriorating, dustproof, and waterproof.

Concrete is one of the materials that has become universally known as meeting these requirements, due to the fact that concrete as a structural material has long since passed the state of experiment and is now universally adopted as one of the leading structural materials.

In buildings such as we require for the manufacture of ice cream, due to the varying temperature required, also due to the moisture caused in the various stages from the raw to the finished product, it is an important factor that the structural steel and iron should be protected from moisture which causes oxidation, therefore, a reinforced concrete type of construction is recommended as a serviceable type for our industry.

Due to porousness of concrete in general caused by voids in the completed product which allows seepage through the material, therefore, there are certain portions of buildings for the manufacture of ice cream, that require absolutely waterproof materials, such rooms as packing rooms, refrigerators, icing and shipping rooms, etc.

The floors, stairs, platforms and driveways receive hard wear and usage, and in addition the moisture and liquids will hasten deterioration. Therefore, the wearing surface should be constructed of the best materials obtainable.

In our opinion, the most important unit in a modern up-to-date ice cream factory is the refrigerating machinery which is in reality the heart of the plant. I have special reference to the compressors. We must have the type of compressor which produces a given result under almost all conditions, with minimum horespower per unit of capacity, and with minimum wear and tear on the machinery; hence, minimum maintenance expense.

When I say that the compressor must be of a design which produces a given result under almost all conditions, it certainly applies in an ice cream factory, which in the summer months operates at times at over capacity, and in addition to the ice cream end of the business produces ice in large volume. This condition, as you will see later, places the compressor under a duty of handling two different suction pressures and in this event the lubrication and oiling system must be almost perfect to expect a smooth operation of the machine.

After careful investigation and having inspected several installations and types of machines, we decided upon the two-cylinder, vertical, single-acting, enclosed type, high speed compressors, direct connected to synchronous motors.

In addition to the two old-style, two-cylinder, single-acting, open type machines, we now have two 12½x14½ two-cylinder, single-acting. vertical, enclosed type, high speed construction, with extended crane shaft and solid flange coupling, each direct connected to 125 horsepower, synchronous motors, operating at 150 revolutions per minute. These machines are rated at 65 tons, refrigerating capacity at 15.67 suction pressure and 185 pounds condensing pressure.

The advantage of the minimum engine room space occupied together with the gain of having no friction loss, as with the bolted type, is an item that should not be lost sight of; and furthermore, with the enclosed type compressor you may frost back onto the machine without the trouble and annoyance of stuffing box leakage of ammonia gas, which is almost bound to occur with the open type, and consequently will require closer supervision on this one point.

Some of you here are undoubtedly skeptical on the subject of high speed machines. These compressors operating at 150 revolutions per minute are termed high speed machines, and when compared with the speeds we have used in past years, it may appear to you as an excessive speed, but when you consider the machines operating at a lower revolution per minute have a longer stroke, you will see that the piston speed is no greater.

These machines have double suction connections, whereby we can operate one or more cylinders on any unit in the plant consisting of the brine cooler, hardening rooms or ice tank. Sometimes we run one cylinder on the hardening rooms, one on the brine cooler and the other machine on the ice tank, and at night one cylinder on the hardening room and the other three cylinders on the ice tank. This gives us a very flexible operating condition and maintains a perfectly balanced system.

In the matter of manufacturing equipment, we cannot lay too much stress on the cleanliness and sanitary features of the equipment. The machines and tanks must be so designed as to make all parts accessible for cleaning and sterilizing. Any type of ice cream freezer will make good ice cream if you give it good material to work with, but we cannot pass over the sanitary features, because of its ability to make good cream.

Sanitary pipe lines are of the utmost importance throughout the plant. These lines must be so construct-

ed and installed so as to be readily detached and easily cleaned and sterilized.

Plenty of water and steam are of the utmost necessity for the proper and efficient cleansing and sterilizing of your manufacturing equipment. It has also been found desirable to use a disinfecting solution of some kind. Of course, it is necessary to use a solution which is practically odorless and tasteless and which will have no objectionable effect on the product—a solution of this sort has been successfully made with chloride of lime and water, and just recently machines have been put on the market whereby a desirable chlorine solution has been made by the electrolysis of salt water—and at a cost that is not prohibitive and which enables the manufacturer to use sufficient quantities to most thoroughly disinfect and sterilize his equipment.

It is almost universally accepted by the manufacturer of ice cream, that the best method of handling raw products is the large tank for storage, mixing and standardization—but to those of us who are dealing directly with a large creamery, I think the proper place to prepare your product for freezing is in the creamery, where more expert care and attention can be given it.

I have touched but lightly on the equipment of a modern ice cream plant and in these times of high costs and prices one is apt to be influenced by quantity and cheapness rather than by quality and endurance and add to the first cost enormous upkeep rather than the first cost of a good article and a minimum cost of upkeep.

This paper, I hope will give you food for thought and consideration in building your new plants—or in the reconstruction of your old.

President Martin: We thank you, Mr. Cunningham, for your excellent paper.

The few remarks Mr. Sutton made put an idea into my mind. I think it would be a splendid thing if the program committee in the future would endeavor to get the sons of some of the men on the program, and let's promote these young fellows and get them to the front. As Mr. Sutton said, they are going to follow the footsteps of their fathers and why not bring them in line here and let them handle this Association in the future?

Next on our program is "Refrigerated Delivery," by Mr. J. H. Schindler, Cleveland, Ohio, chairman, Board of Managers, The Telling-Belle Vernon Company. (Mr. Schindler's address was published in the November issue).

Mr. Luick: I believe Mr. Loewenstein said he would like to have me state what our experience has been with refrigerated delivery trucks. We have had one truck in service this year, and our results are possibly about the same as Mr. Schindler states here. We have had no trouble with soft cream and it uses less ice. In other words, it has conserved the ice that we loaded it with because the body is thoroughly insulated and the ice is covered at all times, the ice being drawn from a chute or spout at the side. Our findings are that we like it and our drivers also like it very well. The improvement suggested by Mr. Schindler of trying to build it with a little less weight is a good one. I don't know whether it can be done, but I imagine it can.

I have had offered to me certain wood that is very light indeed, and at the same time is a very efficient insulator and it seems to me that possibly we could use wood of this kind to build the principal parts of the truck, using only the heavier and stronger wood for the frame work.

I would like to have some of the gentlemen who have used refrigerated delivery trucks and have failed to make a success of them state their experience. I think we want both sides of the story.

Mr. Klinenberg: I operated three of those trucks. I didn't have satisfaction with them. I had to take my cream out every night; the cream was soft when the drivers came back and I used more ice than I used on my other trucks. My drivers like the other trucks a good deal better and we are using considerably less ice with the other trucks than we used with these. I would like to get a little more enlightenment on this.

Mr. Luick: I believe I will take the burden of answering some of the criticism. I am not interested in any refrigerator truck, understand; I am not interested in anything but ice cream business.

I do not think it would be advisable to leave the cream in the trucks over night. Manufacturers that handle their business that way I believe would have to change their method or they would find their cream in not exactly that firm condition that ten below zero would put it. We have found that the average temperature maintained in this compartment is about five to ten above, and that will not give the firm ice cream that ten below hardening rooms will. Therefore, if you try to use refrigerated trucks and keep the ice cream in the truck over night, you make a mistake to start with. If you, however, loaded the truck with ice cream that was thoroughly hard, I believe that it would have made its trip and come back with the ice cream still in very good condition to check in. We believe in checking in our loads in the evening.

Regarding the criticism that you used more ice, I can't quite understand that because it isn't logical. In the ordinary truck, as I know it, the ice is exposed to the atmosphere, most of them having only a light wood cover on the top and some of them no cover at all. It

Do you get what you want when you want it?

AS a manufacturer in good business standing, you have a very good right to expect to. As manufacturers desiring to cultivate business with you, we are aiming to make it possible for you to get our products right when you want them.

That thought is the basic guide in the Merrell-Soule Sales Corporation service policy. Few people have forgotten the very disastrous lessons which were brought out by the recent months of business depression and, therefore, only a few are willing to anticipate raw material requirements.

As a producer of the basic material in ice cream manufacturing, we are bending every effort to make it possible for you to secure our powdered milk products when you want them. The Genuine Merrell-Soule Powdered Skimmed Milk is for sale by the leading supply houses all over the country. One of these firms is near you. Their stocks of our products are being constantly rotated and are, therefore, fresh goods.

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

is very natural that the truck with an insulated cover fitting down tight the ice not being exposed, must conserve the leakage on that ice.

Mr. Klinenberg: We have our bodies built on the same principle. Our ice is covered and our bodies are insulated, one as much as the other.

Mr. Luick: Well, if you are working the other truck under the same conditions, with reference to your packing ice, you should get exactly the same results. I merely made the statement supposing that your trucks were of the average type, and the average type, I believe all the manufacturers will agree, is not thoroughly insulated.

Mr. Gardiner: The gentleman from Chicago has certainly gotten in wrong somehow. A competitor of mine in Baltimore started with a few refrigerated trucks, some of his deliveries being by horses ad others by truck, and now he has a fleet of between twenty-seven to thirty refrigerated trucks and no horses at all. He tells me that he is doing that because of its economy. These refrigerated trucks are saving him in transportation, in ice and in salt and there is no question about the efficiency of the refrigerated truck transportation, provided you start right and keep right. There is no question about it at all in my mind.

Mr. Biedermann: The refrigerated truck has proven quite a success with us. We started out with one, which is a heavy type. We had quite a bit of trouble to start with, but up to the present time we are running ten; we are running four in the country. We have done away with the horses entirely. We ran one down into the country seventy miles this summer. It stays over night and comes back the next day, serving the route on the way in, and we haven't had one report of soft cream.

I haven't got all the data with me, but it takes something like four pounds of ice and a quarter of a pound of salt per gallon on the route. On the old type body we figure it runs considerably higher, about thirty-five pounds of ice and about five pounds of salt. We are going to change them this winter. We figure we have lost thirty-five per cent in meltage on the ice on the route alone on the old type body.

With the refrigerated type body a driver will do twenty-five per cent more work on his route and in a ten-hour day he can make sixty stops, or average 150 gallons a day in the winter-time and in the summer-time he will average 250 gallons and thirty-five and forty stops and get back on regular time.

We are building the bodies in our own factory, making improvements from time to time and experimenting on the different types. I dare say there is quite a bit of improvement to come on the refrigerated type body, but I believe it is here to stay. We have had several complaints with new men; take, for instance, icing the pan. I believe that is the biggest trouble with the brother who just spoke. If it is not iced up properly you are likely to have trouble. If the salt is thoroughly mixed with the ice you get good results.

We have doors on each side, and it is very accessible to the driver; it takes him a very little while to pick out his flavor and get out what he wants.

Mr. Biedermann: We have tried a new scheme; it is on the same order as the refrigerated box. We have built a box that will hold a hundred gallons. This is put on a boat and sent down to Southern Maryland to take care of any picnics or gatherings of large organizations, and we have kept cream five days and still in good condition in the box by re-icing. In case they only use seventy-five gallons, they ship the balance back and get credit for it. We have done that ten or fifteen different times this summer and it worked out very successfully.

Mr. Dixon: In connection with the refrigerated trucks, we have a number of them in our state. They travel a distance of probably one hundred miles. There has been a movement, I haven't heard any decision on it though, for each town these trucks enter, to place a tax of from twenty-five to fifty dollars on each car entering the town, and that, I think, is going to work against the sale of the trucks in our state. If you have seven or eight towns on the route you can readily see what that amounts to.

Mr. George K. Brown: We placed an order early last year for five two-ton refrigerator trucks which were delivered to us along about April. These trucks were operated all through the summer very successfully. We had no trouble with soft cream, neither did we fail to give the proper service to our customers. If I remember correctly, we used about three hundred pounds of ice and seventy-five pounds of salt. Each afternoon, after we made the runs the cream was taken back into the refrigerator and in that way we had no soft cream and the trucks have given perfect satisfaction.

Mr. Olhaver: I would like to ask this gentleman from Washington, D. C., if he figures in the ice that he packs in his pan with his figures to keep the cream on the road at four pounds to the gallon.

Mr. Biedermann: The average per gallon delivered is four pounds of ice and a little over a quarter of a pound of salt. That is the ice to hold the cream in the truck. Our ice runs about thirty pounds.

Mr. Olhaver: We are using both of these systems and we can't get out with any such difference as that.

Mr. Luick: Unless you had been using the old type with insulated covers and sides, you do save ice because of the saving in leakage.

Mr. Olhaver: The other box is insulated, too, and

Is your package easy to remember?

"Putting the name across" is never an easy job. People do not make it a point to remember your name when they see it. But if the package is so designed that it will arrest their attention, if it is striking—"different"—they will begin to remember it after seeing it the second or third time. And they will associate your name with your product.

Then, too, your package must deliver its contents in good condition. And only a house that has learned, through long experience how to build the best boxes can do both jobs well.

We have designed and made boxes for exacting organizations in every branch of business. For more than 20 years we have been improving the packing methods of business houses thruout the country.

Our service department will be glad to send samples and quote prices.

there is absolutely no difference in the saving of ice. We had to buy five-ton trucks to carry bodies that we figured to put on three-ton trucks, because they are so heavy.

Mr. Luick: My experience has been somewhat different. I use a three and a half ton truck to carry a refrigerated body in which we pack not less than 300 to 350 gallons of ice cream with the packing ice.

Mr. Biedermann: We find that our bodies are weighing 3,700 pounds without anything in them, that is, the body alone. We use a three and a half ton chassis and have no trouble at all with any overload.

We find that the driver can deliver his cream with great speed. He doesn't have to dig it out with the hooks and your packages come out in a very dry condition and very acceptable to your customer.

Mr. Gurdy: I think, all told, we have eleven working trucks of that type. We ice them up and stock them the day before, and take them out the next morning at zero temperature.

They are much lighter than the other trucks. They are not under the rules of insulation as much as most of them would care for, but still they have conserved a good deal of ice. We are not troubled with any soft cream. While they have their disadvantages, they still have a great many advantages. A man does all his work from the sidewalk, and never gets wet.

These new ones comply with the light body proposition and are carrying bodies now they say that will carry 300 gallons. There are probably twenty-five of them in use in Boston and suburbs.

45th and Evans Ave. Chicago

NEW GLOBE COMPANY PLANT OPENED JULY 20.

Equipped with the most up-to-date ice cream making machinery and housed in a spotless white structure, the Globe Ice Cream Company held its formal opening in its new building recently.

The new company is prepared to supply 12,000 gallons of ice cream daily. The factory will contain a 3500-horsepower transformer, two 500-gallon pasteurizing tanks, six 1000-gallon holding tanks, glass lined, nineteen miles of pipe, six carloads of cork in the walls of the building, and a fully equipped laboratory, where all milk and raw materials are thoroughly tested before passing into the process of manufacturing.

Will E. Keller, president of the company, and A. A. Comey, vice-president and general manager, designed the building and its various interior devices for making and distributing the product.

The company is an independent organization headed by Keller and Comey. Other officers in the company are Marco Hellman, treasurer; J. M. O'Brien, secretary. In addition to the officers named, C. A. Fellows and Carl Leonard constitute the board of directors.

One hundred people are employed by the Globe Company. Each employee must pass a rigid health test every month.

SPOKANE MAN INVENTS DIPPING MACHINE.

Frank Hardy, manager of the ice cream department of the Spokane Bakery Company, recently invented a machine for cutting and dipping ice cream bars that in all tests made of it thus far has proven very successful.

"The machine is run by a small electric motor, and has a capacity of 922 dozen or 11,904 chocolate coated bars in eight hours," was a recent statement by Mr. Hardy to a representative of the Spokane Chronicle. "The ice cream is made into slabs about two feet long and is fed into the cutter, when a knife cuts the ice cream into the proper size. Holders on a belt conveyor automatically attach themselves to the bars of ice cream, dip them into the chocolate coating trough, and deliver them to the wrapping and packing table without being touched by hand. The bars are then wrapped in foil wrappers and packed in cartons."

"I am thinking about going into politics," remarked the young man.

"My friend," responded Senator Sorghum, "you are a taxpayer, a man entitled to vote and a man responsible to the laws of your country. You are already in politics and you couldn't get out of it to save your soul."

PAPER VESSELS ARE POPULAR FOR SANITARY CONTAINERS.

Organizing For Group Depreciation Studies

A PLAN to assist manufacturers in the different lines of industry in determining depreciation for tax purposes has been worked out by the Fabricated Production Department of the Chamber of Commerce of the United States. Use of this plan is being urged by the department.

The plan provides that "within the trade association of a given industry a depreciation committee should be appointed, consisting of from five to seven engineers, cost accountants and plant superintendents selected from the department."

The Fabricated Production Department has received the endorsement of the Treasury Department in the following letter from the Honorable C. P. Smith, Assistant Commissioner of Internal Revenue, of co-operatively determined depreciation rates by each line of industry.

Treasury Department, Washington.

Mr. E. W. McCullough, Manager,
Fabricated Production Department,
Chamber of Commerce of the United States,
Washington, D. C.

My dear Mr. McCullough:

Reference is made to your letter relative to your suggestion that collective studies of depreciation be made by the several industries.

In your letter of October 7 you state:

"In connection with its cost education work, this Department has noted much uncertainty on the part of business men as to the proper deductions for depreciation and wide divergence in rates actually taken and allowed in any given industry.

"It has occurred to us that this situation could be considerably improved if each industry could be induced to make a scientific study of its own depreciation situation and determine for itself the typical rates of depreciation applicable to the different classifications of property therein. It is not intended that such rates of depreciation should cover all cases but they would serve as a guide or criterion to cover usual conditions of use and production for a given industry."

The Bureau of Internal Revenue looks with favor upon the investigation and study which is contemplated by your two letters referred to above. The Bureau will not, however, feel bound to any determination as to reasonable rates of depreciation for different industries which might be fixed by this investigation.

Yours very truly,

C. P. SMITH,
Assistant Commissioner.

The advantages of such an investigation and study to determine basic rates of depreciation are fully set forth in the foregoing letter:

First. It will tend to minimize friction between the taxpayer and the Treasury Department.

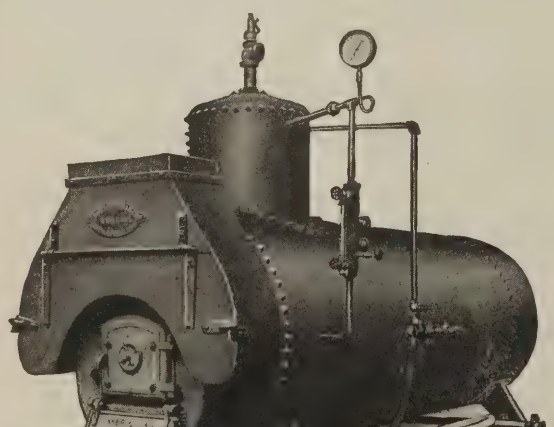
Second. It will give the business man more definite information than usually exists as to what is properly chargeable by way of depreciation.

Third. It will tend to eliminate cost inequalities that arise from unjustified discrepancies in depreciation rates and depreciation methods.

Group rates for wear out depreciation were successfully established in 1920 by the National Association of Ice Industries in co-operation with the Treasury Department. The following are the rates agreed upon after an exhaustive investigation:

Treasury Department, Washington,
Office of Commissioner of Internal Revenue.

Mr. Leslie C. Smith, Secretary,
National Association of Ice Industries,
136 West Lake St., Chicago, Illinois.



Sir:—You are advised that very careful consideration has been given to the proposal concerning rates of depreciation submitted by the Committee of Depreciation of the National Association of Ice Industries, supplemented by personal interviews, with the result that it has been agreed that the following percentages of the original cost necessary to be set aside each year in a fund for "wear-out depreciation" will be acceptable to this Bureau as a fair and reasonable rate of depreciation:

For wooden natural ice houses and wooden storehouses	6 4/10
Ice houses, harvesting and hoisting machinery, including conveyors, hoists, merrimacs, basin saws, etc., and power plants for same, elevators	9½ %
*Machinery of steam driven manufacturing plants	7 1/10 %
Machinery of electric driven manufacturing plants	7 3/10 %
Frame buildings	5 %
Brick buildings	2½ %
Concrete buildings	2 %
Horses	15 4/10 %
Harness	16 2/10 %
Wagon and other horse drawn vehicles	14 3/10 %
Automobiles	22 5/10 %
Motor trucks	22 2/10 %
Sundry delivery equipment	15 %

*In case of bad water, this figure to be increased up to 7 6/10% as a maximum.

**In case of the Southern States, where a different grade of vehicles and horse is used, these figures become 20% for vehicles.

It is also recommended that the following line of demarcation be established on which to base the above rates of depreciation.

Wearout depreciation and maintenance are to be separated according to the definition of wearout depreciation, which is that loss of original usefulness which has gone so far on any "Unit of Utility," beyond the ability of repairs to correct, so as to make necessary the complete replacement of that "Unit." By maintenance (synonymous with repairs) is meant the correction of some local defect of a "Unit of Utility" by bringing the defective portion in the easiest way, into practical parity with the general condition of the remainder of the "Unit." By the definition of a "Unit of Utility" is meant a single purposed mechanism or part of a construction, subject to such like conditions of use, that it would naturally be repaired or replaced as a unit.

The depreciation situation of a given industry can be best studied through the trade association representative of the line. If such trade association does not exist one should be formed.

Within the trade association a depreciation committee should be appointed, consisting of from five to seven engineers, cost accountants and plant superintendents selected from the industry.

Such a committee should prepare a questionnaire providing for a listing of the units of utility, the cost of same, estimated scrap value, and years of useful life.

For purposes of illustration the following hypothetical depreciation schedule is given:

Item	Cost New	Estim'd Scrap Value	Yrs. of Useful Life
Five-ton Auto Truck	$5,200	$400	5
Electric Air Compressor, 110 v.	225	15	6
20-ton Steam Shovel	8,250	500	6
Dump Wagon	150	25	10
Centrifugal Pump	250	25	8

Before sending the questionnaire to manufacturers of a given line certain preliminary points should be cleared up, such as:

(a) Method of charging maintenance, renewals and depreciation.

(b) A statement of the elements of depreciation.

(c) Determining of stated conditions of use.

Further comment is made on the above points as follows:

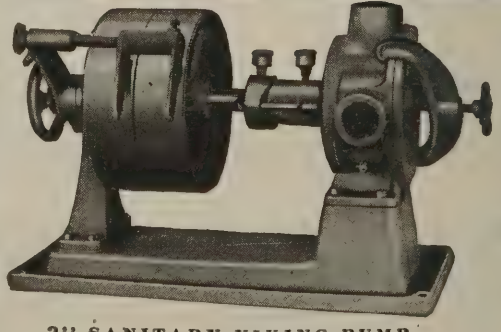
a. **Method of Charging Maintenance, Renewals and Depreciation.** It will not do merely to average the various estimates of useful life provided by the manufacturers of a given line, because the methods of charging maintenance, renewals and depreciation may not be the same. Thus, one manufacturer may charge as maintenance all repairs and partial renewals. By this method the laying of a new roof on a building would be charged as maintenance. Another manufacturer may charge to maintenance only such items as tend to keep the property in the same general condition. The laying of a new roof adds to the life of the asset and accordingly would be charged to the depreciation reserve. The first method gives a high maintenance rate and a low depreciation rate. The second method gives a low maintenance rate and a high depreciation rate. Suppose the first manufacturer charges 2% for depreciation and the second 8%. It will not do to average these rates and set 5% as the guide for the industry. That would not give a true picture of actual conditions.

Before the rates of depreciation can be standardized for an industry the methods of charging maintenance, renewals and depreciation must be standardized.

b. **A Statement of the Elements of Depreciation.** Accompanying the questionnaire should be a statement of the elements entering into depreciation, wear and tear, and obsolescence.

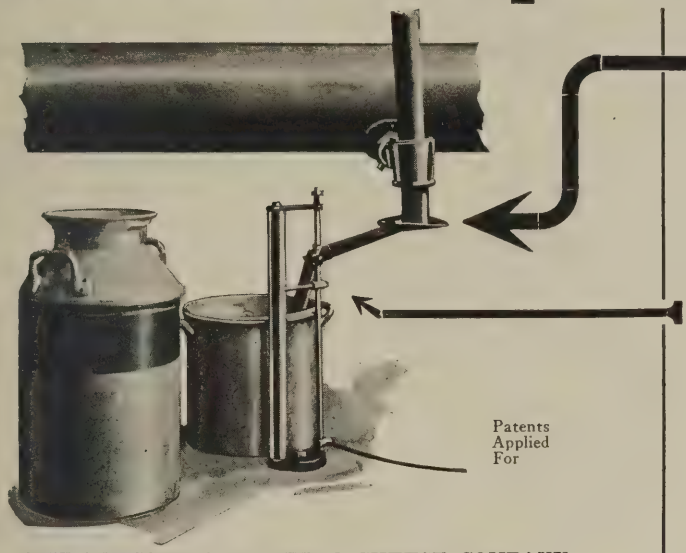
Wear and tear is defined as "that uniform wear-out and decay which repairing is unable to check" and it is dependent upon the amount of use, the amount of care, the quality of the installation and the natural hardships to be overcome.

Obsolescence arises from "an inability to compete in kind, in quality or in cost of desired results with later forms of the same utility." Allied there is that change in demand which displaces the whole life of equipment.



It is important that the Depreciation Committee secure sufficient facts for it to come to a conclusion as to which is the factor, obsolescence or wear and tear, determining the useful life of a given unit of utility. Certain machines are not given the opportunity to wear out, they are replaced so rapidly because of improvements in the art. Clearly obsolescence is here the determining factor.

c. **Determining Stated Conditions of Use.** Guide rates of depreciation for an industry presuppose stated conditions of us,—the number of days of operation in a year, the number of hours of operation per day, a standard of maintenance, external conditions, such as climate and road, etc.



With the normal conditions of use stated, it will be possible to provide for variances thereof upon a scale of percentages. Thus, during the war additional rates of depreciation were allowed for overtime operation, and when depreciation can be based on an incident of production, capacity, or performance, it may be feasible to scale the rate of depreciation for subnormal production.

A study of depreciation by industries will reveal an inadequacy of records and information and, that the

Mr. E. H. J. Lorenz, Elkhorn, Wis.
Dear Sir:

Please be advised that the Lorenz Model Drip Catcher which you recently installed in our plant at Elkhorn is proving most satisfactory. We were astonished at the remarkable saving that this device showed in its use and we feel that it has paid for itself many times during the short period that we have had it in service. We would be unwilling to dispense with its use for many times its cost if we were unable to get another one.

Yours truly,
THE WISCONSIN BUTTER & CHEESE CO.

"THEY CAN BECAUSE THEY THINK THEY CAN."—VIRGIL.

gaps may be filled, it is advisable that each firm keep a property ledger giving a complete depreciation history of each unit of utility. Details concerning the operation of such a plant ledger, together with a suggested form, will be found in the Fabricated Production Department's pamphlet, "Depreciation — Its Treatment in Production." For the time being, the information supplied by the questionnaire may be supplemented by experience tables, and by information gleaned from the manufactures of equipment and from appraisal companies.

Upon a return and digest of questionnaires, schedules should be prepared showing items of utility, cost, scrap value, and useful life. These schedules should be submitted to the manufacturers for criticism. Upon revision a conference should be arranged with the experts of the Treasurey Department that the depreciation data may be checked by them.

When so checked the rates of depreciation should be promulgated as guide rates for the industry, it being thoroughly understood that such depreciation rates shall be merely suggestive and not mandatory and that in the last analysis each concern must determine the depreciation allowance out of its own individual experience.

On the other hand it is confidently felt that guide rates of depreciation so co-operatively determined will minimize friction between the taxpayer and the Treasury Department and will give the taxpayer more definite information than customarily exists as to what is properly chargeable by way of depreciation.

GIVING ICE CREAM ITS TRUE FLAVOR NAME.

At the last convention of the Wisconsin Association of Ice Cream Manufacturers, Harry Klueter, Assistant Dairy and Food Commissioner, delivered an address reports of which have been misunderstood by many ice cream manufacturers, so far as the flavoring of ice cream is concerned. In a very good talk, which was highly appreciated, he used these words:

"Now just a word about maple ice cream. There have been some complaints to the effect that maple ice cream could not be successfully manufactured and sold unless the dealers were permitted to use one of the several imitation maple extracts that are now on the market. The definition and standard for maple ice cream says that the product must be made by the use of maple sugar or maple syrup. It does not say that you cannot make an ice cream with some other flavor which tastes like maple if that product is honestly sold, that is to say, if Mapleine is a natural flavoring, as the standard for ice cream requires, then it is permissible to use Mapleine, but the product would not be maple ice cream, but Mapleine Ice Cream. This is only business honesty."

There was nothing said by Mr. Klueter, in the above or in the rest of his address, to lead ice cream manufacturers to conclude that they could not use Mapleine, but some reached that conclusion. So many requests have come to us for information on the subject that we are glad to quote from a letter received from the Crescent Manufacturing Company, manufacturers of Mapleine, as follows:

"If Mr. Klueter is correctly quoted there is nothing unreasonable or impracticable in the position taken by the Wisconsin Commission and nothing which would interfere with the free use of any wholesome and popular flavor in ice cream. Mr. Klueter especially mentions Mapleine as a 'permissible' and therefore wholly legal and proper flavoring for ice cream, provided, of course, that it is not labeled or sold as 'maple.'

"Mapleine need not be sold as maple. It has attained nation-wide recognition as an original and distinctive flavor under its own name.

"It is used for many purposes for which maple is not at all suitable, and as a flavor for ice cream it has become extremely popular because of its own merit.

"In many hotels it is on the bills-of-fare as Mapleine Ice Cream, Mapleine Nut Sundaes, etc., and we are furnishing many dispensers with attractive card signs bearing the legend 'Mapleine Ice Cream.'

"Ice Cream makers have developed a very attractive volume of sales on ice cream flavored with Mapleine identified by a trade name of their own choosing, with no suggestion of either maple or Mapleine. The flavor pleases and consumers want more, their only interest in the ingredient being that it shall be wholesome and nutritious, and the taste attractive.

"Some local ice cream makers sell bricks and other ice cream which they give names like 'Princess Brick,' the flavor or flavors not being mentioned on the wrapper. While a large Western ice cream manufacturer makes week-end specials, a recent one being 'Puritan Brick,' the flavors consisting of Vanilla, Mapleine and Macaroon. This manufacturer announces the name of the brick and the flavors by means of posters which he furnishes the trade, and does not hesitate to feature Mapleine with Vanilla and other flavors on these posters.

"Mapleine harmonizes and combines with so many other flavors in producing new and delicious results that it is one of the most useful as well as the most economical flavors in the ice cream maker's list."

Retinning Ice Cream Cans

SPECIAL DEPARTMENT

Old Cans Made New at Low Cost

We do refinishing of old ice cream cans in a special department of our plant which devotes its entire time throughout the year to doing this one thing and doing it well.

Sample Can Retinned Free

And we do know how to fix up your otherwise hopelessly rusty old cans so they will be tight and bright and good as new. ***It is not expensive*** and ***pays you a dividend.*** A can retinned by us has a thicker coat of Pure Block Tin than when new.

Send us a sample can NOW. We will repair and retin it without charge and return it promptly, so you can see the quality of our work. Write us when you ship it, so we will know whose it is, and we will do the rest.

OAKES & BURGER COMPANY

Established 1873 **CATTARAUGUS, N. Y.**

Ice Cream Conquering Britain

An interesting communication from England reached us recently when we received the following letter from A. Pompa, editor of The Ice Cream and Soda Fountain Journal, the only publication of its kind in England:

Garibaldi Club,
10 Laystall Street, E. C. I.,
London, England.
3rd June, 1922.

To the Editor of The Ice Cream Review:

This morning Mr. Charles Goeglin, our most up-to-date dispenser-manager over here, showed me the first copy of your wonderful Review that I have ever seen. I must plead ignorance of its existence although I would say that when I founded the Federation and its Journal four years ago I was only aware of the New York journals. I'm glad I went to Selfridge's this morning.

A. POMPA.

Really, you have THE ice cream paper of all and I regret very much not having known of it before.

I beg to enclose one of our Association Booklets and one or two circulars we have sent out from time to time, and would take the liberty of asking you to place me on your exchange list so that we may have each other's monthly Journal. Mine is still a section of the Confectioners' Union, the oldest confectionery paper over here. Started as we were during the war I could not issue a new publication owing to paper restrictions, so had to beg and pray for a section in an already established trade journal. However, this reached the best of the trade so it actually did us more good than harm, especially as regards soda fountain propaganda, because our original members were rather of the street-trading class.

We have moved things over here, without exaggeration. The number of retailers has doubled in two years and is now 60,000. Wholesale plants are opening all over the place and only yesterday the papers had the report of the first soda explosion over here. Why, only last year no paper would have mentioned "sundaes" or "fountain" without explaining to its readers what they were and how they were made.

May I trouble you to insert a request to your advertisers to let me have all the latest catalogues, literature, price lists and illustrations? We want the latest information because the trade is increasing by leaps and bounds and we want the best.

All credit to Gordon Selfridge who planted the first front service fountain here about 12 years ago and has shown others how to sell ice cream and taught the public how to eat it. His dispensers have helped, too.

In August a party of American business men connected with our trade is coming over here to study the ice cream situation and it will be a great pleasure for me to show them around. I have had big correspondence with friends over there and am eager to meet them, especially as my many attempts to make a trip to see things in the States have never materialized.

Would I be too rude to ask you to let me have any spare back numbers of your Review? I am interested in the trade, and in the trade only, and see such a mine of information in all your issues. Thanks in anticipation.

You may make use of me whenever you wish for news, information, messages and so on. We have learnt from the States and are only too pleased to reciprocate.

With all best wishes for further successes and with greetings to all our unknown friends in the States,

Yours faithfully,

A. POMPA,
Secretary and Editor.

The publication is devoted to the improvement of the ice cream industry in England, and should be of great benefit in stimulating the activities of the trade toward increased production and wider distribution.

An idea of the nature of Mr. Pompa's efforts to acquaint his readers with better methods of production may be gained from the following extract from his publication, evidently one of a series of articles on preparation of the ice cream mix:

"Coming more towards ice cream, and leaving the chemical descriptions for another time, we had better get a reminder of what America has classified our trade into. There are nine names for ice cream: Plain, nut, fruit, bisque, parfait, mousse, pudding, aufait and lacto. Then comes ices, which also include sherbets (Italian 'Sorbetto,' and 'Sorbettiera' for freezer).

"Plain ice cream, according to the U. S. A. Pure Food Law, is made from cream and sugar, with or without flavouring, and contains 14 per cent milk fat.

"Fruit ice cream is the above, plus sound, clean and mature fruits and should contain 12 per cent milk fat.

"Nut ice cream contains sound, non-rancid nuts and contains 12 per cent milk fat.

"And so on.

"And now a few words about flavour, body, texture, swell, age, fat content, temperatures, acidity and so on. Ice cream, although a food and a very good and nourishing food at that, is still eaten as a luxury and a refreshment more than as a food. For instance, if you are hungry you think of bread or other food, not ice cream.

The BAKER Ice Machine

Why is it that so many ice cream manufacturers so frequently select the Baker after a careful comparison of all other makes?

Another question: Why is it that you so rarely see a Baker Machine sold on the second hand market although over 5,000 installations have been made in the past 17 years?

Think it over!

A Slow Speed Compressor Gives Longer Service

If you run a horse at top speed all the time he soon wears out and so it is with an ice machine. The Baker is a slow speed type and can be relied upon to hold perfect temperatures for many years to come. We doubt if you can find anywhere a more economical working machine than the Baker.

Every Ice Cream Manufacturer Should Have Our Free Booklet

Gentlemen:
Please send us your booklet No. 65D.

Name .....

Street .....

City..... State.....

On the other hand, if you are thirsty you'd think of water. But when you are partly both and you have money, you'd think of ice cream. It suggests pleasure more than it does necessity, doesn't it?

"Its flavour depends on the absence of contaminations, purity of ingredients, quality of ingredients and method of manufacture. For instance, a rich cream makes better ice cream than thin, milky cream.

"As already stated the cream should not contain more than ¼ per cent (0.25) of acidity. In fact 0.16 per cent is best as no sour taste is discernable. If it does the cream should be carefully treated with baking soda or viscogen (sucrate of lime), or mixed with 5 to 10 times its quantity of sweet cream. In fact this is better because too much soda or lime may produce a very alkaline and bitter flavour.

"Another great flavour secret is to add not more than half a teaspoonful of salt to the gallon of cream. It is also a well known fact that ice cream tastes better when it has been frozen for 24 hours. It takes about that time for all the flavours of the various ingredients to mingle into one pleasant taste, which is better than having one customer speaking of milk he can taste, another of flour, and so on. So the American system of placing their 'containers' (freezers) in the hardening room for a day or two is not so silly as some of us think or thought. There is always a reason for all they do over there, where they have been studying the trade for as many years as we have months.

"The 'body' is produced by the milk solids and other ingredients used. Ice cream should be firm and mellow, not hard or rubbery. Cream containing 18 per cent fat is the lowest that should be used; 22 per cent is about the best. Then again remember that aged cream makes a better ice cream. It should be kept for a day or two days at a low temperature, say 35 degrees and then used, especially if it has been pasteurized.

"Thick cream will not require much gelatine, cornflour or other binders.

" 'Texture' and 'body' seem the same thing, but there is a difference. Body is used for the whole of the frozen contents of the freezer, texture for the description of the 'grain,' such as smooth, grainy, crystallized, icy, and so on.

"Freezing has more to do with a fine texture than even the ingredients. For instance, freezing without beating or agitation produces an extremely coarse product hardly anyone would buy a second time, however good the ingredients. Freezing too quickly produces an ice cream that is coarse and full of large water crystals. A proper freezing is the one that incorporated about 30 to 40 per cent of air, beats it up with the cream and produces that velvety, smooth, and light article your customers rush for because the water content of the cream, milk, etc., freezes into very small and fine crystals thoroughly interspersed with air bubbles. Gelatine, etc., helps to maintain this smoothness for days after freezing if kept frozen.

"The 'swell' is the increase of the volume of ice cream after freezing. The better the freeze the more the swell and, of course, the better the flavour and the profits. Aged cream produces a better swell than fresh cream.

"The great secret about obtaining a good swell is not a secret. I'll tell you easily. The ice and salt in the tub gradually cool the contents of the freezer. Till a temperature of 34 degrees F. is obtained hardly any air will keep in the cream. But as it gets there and even a little lower, the cream foams up more and starts increasing in bulk, i. e., incorporating air and, what's more, retaining it. Then when it reaches 29 degrees or 28 degrees (the freezing point that varies according to

he proportion of sugar used) it increases in bulk very quickly all the time the temperature keeps at 28 degrees. Perhaps you will ask how long does it keep at 28 degrees? About 5, 10 or even 15 minutes, according to the rate of freezing. It is this point that has to be paid much attention. When freezing by hand one is apt to feel tired and leaves off beating it up and scraping down the sides, but it is a very foolish and a very costly thing to do.

"At 27 degrees the ice cream is well frozen; in fact, it should not be touched any more, otherwise the air will find its way out and you lose the swell. Neither must the ice cream be removed from the container; the warm air will form icicles and spoil the flavour. The container should be repacked with ice and salt so that the contents become frozen harder. After 24 hours the flavour reaches its best point and that is the time to serve it."

An idea may be gained from this what a relatively elementary stage the development of the business of ice cream making is over there, and what a field there is for Mr. Pompa's efforts. The enthusiasm with which he is entering into his work augurs well for the future of the business, however.

An interesting extract, which gives part of the history of ice cream, is contained in another article, and reads as follows:

"Little by little the number of ice cream retailers, mostly manufacturers, in the United Kingdom, has increased to 45,000 and each will state that his sales increase every year and that he is looking forward to a record year in 1922.

"What is the reason for this great increase that makes the ice cream trade similar to that other rage of recent years—the cinema trade?

"And why is it that in the United States, where there are over 4,000 wholesale ice cream factories and nearly 200,000 retailers of the delicacy, the annual output has gradually increased to 300,000,000 gallons? And this is not calculating the great amount that is made at home all over the States.

"The reason is simple. More knowledge of the art of ice cream blending and making.

"With the exception of the frozen or cooled fruit juices served during hot marches to Alexander the Great in Asia Minor and of the milk and water ices that Marco Polo noticed during his journeys to China and Japan about A. D. 1200, it is customary to state that the first mention of ice cream as a national dessert is connected with the marriage of Catherine de'Medici of Florence to the King of France in 1539, when she took with her Italian chefs to make ice cream at her table.

"In those days ice and salt were not used but a freezing mixture was made with saltpetre and water to surround the freezer containing the ice cream.

"Evidently the idea caught on in France because we read of many Italians (and Frenchmen, afterwards) opening smart glaceries or ice cream bars, where the aristocracy were wont to spend part of their time in partaking of the refreshments and strolling in the gardens attached to the bars. The first of these was Procopio Coltelli, who is also credited with the invention of the first mechanical freezer.

"Another well-known Italian was Demirro or Demarco, who became chef to Charles I of England and received an annual pension of £20 (a lot in those days) providing he kept the recipe of ice cream a secret from all others.

"About eighty years ago the so-called Swiss-Italian shops were started in London, the best known being Gatti's in Villiers Street. Italian ice cream became a rage then over here and many fortunes were made by

Mr. F. M. Hosler *Says:*

"I use gelatine in my ice cream because it makes it more palatable, and it adds to the food value. It makes the ice cream easier to digest, and I have used "SX" Gelatine for years, because I have found that it never varies in strength. Its high quality does not change."

Mr. Hosler is President of the Hosler Ice Cream Company, Albany, N. Y. His product has a splendid reputation. He has made a success of his business. The "SX" brand of Gelatine carries its own standard of quality and purity. It is the result of twenty years of manufacturing experience. A shipment to you today will prove why it is used by leading ice cream manufacturers.

Rogers Automatic Ice Cream Brick Maker

In years and in achievement, the Ice Cream brick making industry is still young. Some of its longest forward steps are being taken today. One of these long forward steps is already plain in the Rogers' Ice Cream Brick Maker, an automatic machine in which the making of one, two or three color bricks has been completely solved.

There is not a brick making machine in the world today that will make bricks like this one. The Rogers' Brick Maker produces a brick far better than has ever been produced by hand. The division between the colors is distinct and they do not run together.

The Rogers' Automatic brick Maker is a revolutionary proposition in the making of ice cream bricks. It does away with all brick slabs, brick cutting, parchment paper wrapping, and handling, and at the rate of 4 gallons per minute, 960 quarts or 1920 pints per hour, and at this continuous rate delivering boxes purely automatically.

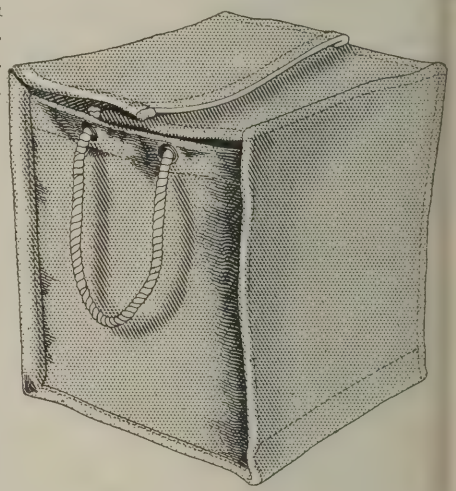
INDIVIDUALS

Probably the greatest revolution in any brick filling machine is the possibility of individual bricks with the Rogers' Automatc Brick Maker. With this machine, individuals can be filled, either 6, 8 or 10 to the quart, which can be removed from the carton and sold or served at any and every occasion.

JOHN W. LADD COMPANY

"National Approved Ladd *Distributors Specialists"*

DETROIT CLEVELAND



the shopkeepers and also by poorer and less educate Italians who started a livelihood with small barrows Unfortunately many of these were only here to escap the political tyranny obtaining in the various State Italy was then divided in, and to earn a living of som cort. They had no business ideas, no pride in what the did, no ambition to own smart shops, cafes or restau rants, and therefore no idea of studying their trade They just made a sort of ice cream and sold it casuall to children from their street barrows, not always clea or attractive.

"That was very prejudicial to the name of the trad and although it is a thing of the past there are still som persons who dread eating ice cream. Moral: Alway be clean and attractive and try and induce others to b so. It all helps to increase the name and amount o trade."

Mr. Pompa is to be heartily congratulated upon his efforts, and his work should be appreciated by those engaged in the trade across the water, for he is doing much to advance the industry.

THE "I-SAK" CARRY OUT PAIL.

of the Alsak Corporation, Yonkers, N. Y. One of the arguments in favor of this package is that an imperceptible escapement of moisture through the canvas sides causes constant coolness, thus causing the ice to last longer and permitting the use of a smaller quantity. They are made in any size desired and require little storage space when folded.

N. W. ICE CREAM COMPANY BRANCH TO OPEN AT ESTHERVILLE.

Estherville, Iowa is to have another new ice cream factory, in addition to the Hutchinson Ice Cream Company of Spencer, Iowa, is fast nearing completion, and is expected to be in operation soon.

The business of this concern was so large that it was necessary for them to establish a branch plant, and they selected Estherville as the most advantageous location.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in The Ice Cream Review.

Specialization in ice cream and milk products enables us to serve you to YOUR advantage. Ours is a "Plan" to economize for YOU. Write — right **NOW!**
SANI-DAIRY PRODUCTS CORP'N, 45th and Evans Ave., CHICAGO

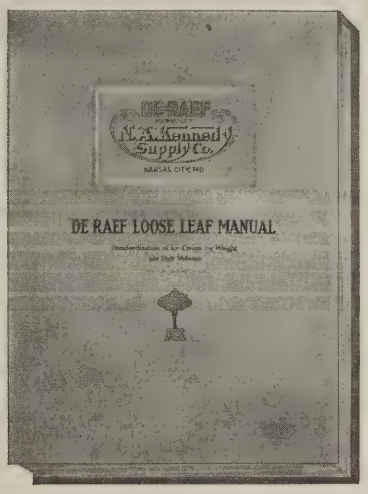
Advertising

By Peabody, in SX, Published by Essex Gelatine Co., Boston.

There is no question but what advertising is the great power of business; that is, the right kind of advertising. For the wrong kind can do as much harm as the right kind can do good. But it is hard to define the "right kind." There is no formula for successful advertising. No one plan can be established with the guarantee that it will work. Conditions vary with every product and with every community. A successful campaign for an ice cream manufacturer in Chicago might be a miserable failure for another in New York. Because of limited space only a few general statements can be made here about this great business-power.

First, there is the appropriation to be considered. And there should be a definite advertising appropriation and only advertising should be charged against this. Too many advertising accounts are convenient things to be charged with homeless items which are not advertising.

"How much shall I, or how much ought I to spend?" you ask. One might as well ask the old question, "How long is a piece of string?" The amount of the appropriation depends upon several things. One thing to be remembered, however, is this: Whatever the appropriation, be sure that it is spent so that it will develop maximum power in producing sales. Don't follow what some competitor is doing or has done. His problems may not be yours.



If you advertised last year you have a line on what to spend. If not, you can determine the amount of your appropriation, as many do, by establishing it as from one to three per cent of the anticipated sales volume over the period you expect to advertise. In other words, you expect a certain volume of sales. You know how much or what you can afford to spend for this volume. You know what it will be worth to you. Then begin your campaign on the basis that you are going to make the volume estimated upon.

With the amount determined upon, the next question is,—How shall I spend this? And right here let me say this: That if you do not know anything about advertising, do not attempt to work out your own campaign any more than you would your own case at court, or prescribe for yourself if you were ill. The services of an advertising man will cost you something to be sure, but you will obtain more satisfactory results. And somewhere in your locality is an advertising man who will work on your campaign for just the length of time necessary. Select him as you would an attorney. Be sure that he has had experience; that he has made good on previous work. You don't want a doctor to cut out your appendix just so that he may have a little practice.

There are four general forms of advertising which may be followed. First, are the newspapers in the territory you want to reach. Second, there is the medium of direct-mail advertising. Third, there is the bill board and fourth, there is what we will term dealer-help advertising. If the writer were an ice cream manufacturer he would try to use all four with proper balance. If his appropriation would not permit the use of all four, he would eliminate the bill board and concentrate upon the newspapers, direct-mail and dealer-helps. If he felt

that he was limited to one form he would select the dealer-helps.

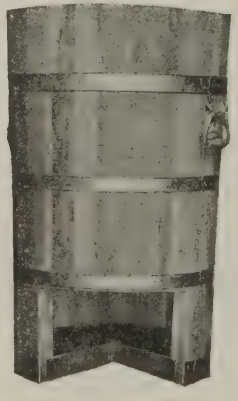
First, however, the market must be studied. And right here the writer wishes to point out a common error that is made by many who are unfamiliar with advertising. And that is this: That only in rare cases will consumer advertising force a dealer to handle any given line. Part of the advertising must be directed to and planned for the dealer. For the dealer is the final point of sale. You as an ice cream manufacturer might spend a great amount in advertising your ice cream to the consumer. But if you had not gained dealer good-will, your advertising, or much of it, would be waste.

In the study of the market, then, it must be determined how much sales resistance there is in the consumer-group and the dealer-group. It must be determined how much of the advertising will be directed toward the dealer and how much toward the consumer. If it is decided that all four forms can be used, then it must next be determined to what group the different forms will be directed.

Through all the advertising there must be some continuity, some tie-up. Hit and miss advertising never accomplishes what a well worked plan will accomplish. By the way of illustration, there came to the attention of the writer a case of an ice cream manufacturer who was approached by a salesman who had some dealer help cut-outs to offer. These were very attractive and the dealer purchased five hundred. These cut-outs, however, had no relation to any other advertising that that dealer had done or might do for the season. The dominant feature of this cut-out illustration was a woman holding a plate of ice cream before a parrot, with the woman trying to make the parrot speak the name of the ice cream, for illustration, "say Smith's." Now, if that manufacturer had planned his campaign in advance and it had called for this illustration he would feature it in all of his advertising. The newspaper advertisements would show the parrot, the poster advertising would do the same, the parrot would appear in the dealer-help material and on the letterheads and billheads of the company as well as on the tubs and the sides of delivery wagons. In the newspaper campaign the last advertisement to appear should be worked out or in rough form before first insertion. And from the first to the last there should be a definite line of movement or action; and this applies to the direct-mail campaign. The poster advertising may be more unit advertising; in other words, each poster may be a unit unto itself more than either the newspaper or direct-mail advertisement. In all advertising, however, the one big idea must dominate.

Care must be taken in the preparation of the copy. It must contain selling argument; it must carry sales ammunition. To state simply that "Doe's Ice Cream is Best" is to say nothing. Is there any reason why one should accept such a statement over Doe's signature? If Doe, however, would tell why his ice cream is better, then his audience would be interested and convinced. Take the matter of gelatine. The majority of ice cream manufacturers use gelatine. If Doe in his advertisements was to say that he used in the manufacture of his ice cream the finest gelatine he could buy and named it, say Essex Gelatine, then there would be ample reason for preferring and for demanding Doe's Ice Cream. Again, if Doe were to show a picture of his factory and to emphasize the fact that exacting care is taken for cleanliness in every process of manufacture, unquestionably it would influence. Or to go back to gelatine again, if Doe were to say that gelatine was a product of food value, that it made the ice cream more digestible, and that he used only the finest gelatine, people would feel more kindly toward his product.

As has been said, however, there must be a line of demarcation between the consumer copy and the dealer copy. The dealer copy must sell the dealer on the advantages of handling Doe's ice cream. By way of example, the direct-mail advertising sent to the dealer should illustrate the cabinet that is given; or the sales helps that are given, such as window display material, cut-outs, etc. This copy should place emphasis upon the promptness of delivery or the frequency of delivery. It should mention matters that are of particular interest to the dealer and of no interest whatever to the consumer.



Much advertising is waste. It is waste because the market is not studied, because the copy is not written to meet any definite market. Illustrations are used which mean nothing. There is little of sales ammunition put in either copy or illustration. It is waste because the whole campaign as a unit is not studied out in advance.

Advertising properly used is one of the greatest factors in the upbuilding of a business. But it must be

Gentlemen:

It is now four years since we started handling your Meridale Brand Milk Powder, and in addition to the fact that our relations with your concern have been of a most satisfactory nature, we are glad to be able to add that during the period that we have handled your product, we have never had a complaint on the quality of the Meridale Milk Powder.

Yours very truly,
Jos. Middleby Jr. Inc.

DISTRIBUTORS:—Jos. Middleby, Jr., 327-347 Summer St., Boston, Mass. Lee & Saddler Company, Atlanta, Ga. Haines-Carpenter Dairy Products Co. 716 N. 18th Street. St. Louis, Mo. SOUTHERN REPRESENTATIVE:—C. Gibson Ford, 1012 Union Trust Building, Baltimore, Md

properly and intelligently used. In an article of this length full justice cannot be done to the many phases of it. Rather, only a few general suggestions can be given. To sum these up, then, first a definite appropriation must be determined. Second, the market must be studied and the mediums for reaching that market. Third, copy and illustration must contain selling facts. For after all, advertising is salesmanship on paper, and would you permit one of your salesmen to use the empty, banal argument, "This ice cream is the best?" And fourth, if the maximum returns are to be received there must be continuity through all the advertising. It must be founded on a plan which is carefully thought out in advance.—Peabody.

HUTCHINSON ICE CREAM COMPANY BUYS GRAAF PLANT.

A deal was recently closed whereby the Hutchinson Ice Cream Company of Cedar Rapids, Iowa, came into the possession of the ice cream factory of Estherville, Iowa. They also acquired lots owned by Mr. Graaf adjoining his place of business, where they expect to erect a modern plant some time in fall or winter. This building will be of brick, and will be constructed with a view to future enlargement. It is estimated that the cost will be $30,000.

Ralph Rosseau, who has been in the ice cream business in Estherville for several years, will be manager of this plant, and Leo Sanders, formerly at the Graaf plant, will remain here to operate the new plant.

The splendid railroad facilities of Estherville make this an ideal location for an ice cream factory, and its success is practically assured.

Magnificent New Plant of M. & G. Ice Cream Company Opened at Allentown, Pa.

WHAT is generally conceded by experts to be the finest and most complete, up-to-date ice cream plant in the world was formally opened the week of June 24th, when the mammoth new building of the M. & G. Ice Cream Company, at Allentown, Pa., was thrown open to the public with appropriate ceremonies.

This building has recently been completed at a cost of $600,000, and embodies everything that is modern in structure and equipment. Every detail in this plant, in both factory and office, functions with the highest degree of efficiency for the production of this delicious cream.

The M. & G. Company now has its executive offices and main plant in Allentown, serving all of Eastern Pennsylvania, from Easton to Wilkes-Barre and Scranton, with sub-station at Reading, while the Tamaqua plant takes care of the coal regions, with sub-station at Bloomsburg.

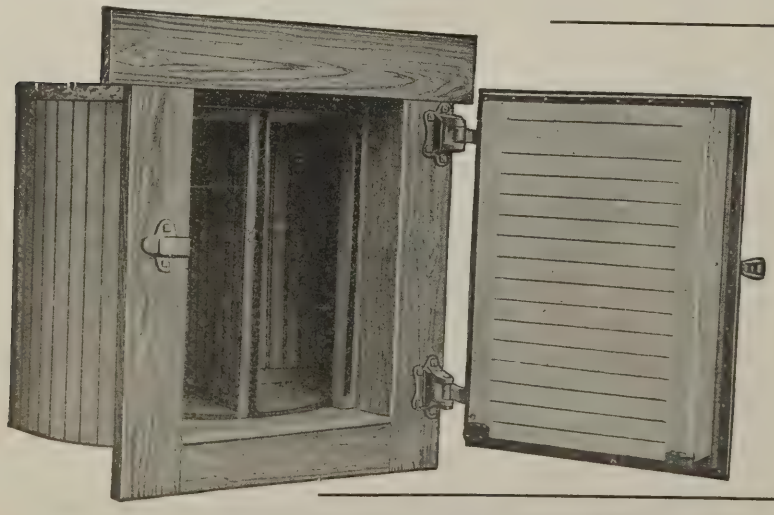
The president of the company, John G. Mealey, and the treasurer, John I. Goade, are both natives of Allentown. Members of the company are: John G. Mealey, John I. Goade, Harvey H. Farr, Oscar G. Tallman, Joseph F. Gorman, John A. Nallin, Edwin O. Bachman, George LeRoy Walker, Carl D. Bauer, and Jacob Mauer.

The M. & G. Ice Cream Company came into existence in 1919. It was on the 24th day of May of that year that ground was broken for the construction of the first plant at Tamaqua. On September 24th, the same year, the first delivery of the famous ice cream was made. From that day on business has increased by leaps and bounds until today hardly a city or village in this section of the state is skipped by the fleet of trucks and teams operated by the company.

The building is three stories high and is of reinforced concrete. It has a frontage on Union Boulevard of 190 feet and 160 feet on Plymouth street. It is truly a sunlight factory, there being used in its construction approximately 12,000 square feet of glass.

To give an idea of the vastness of the factory, the following list of materials entered into its construction, according to the Allentown Chronicle, which also gives an excellent account of the arrangement and operation of the plant.

"Four hundred and twenty-one carloads of material were used, each car holding about 35 tons, or a total of almost 15,000 tons. This includes 30 carloads of cement, stone, and sand for the stone masonry work, and 302 cars of cement, sand, stone, lumber, and reinforced steel for the concrete work, also 34 carloads of bricks, cement, sand, and lime, for the brick work; 12 tons of steel sash, 10 tons of glass and putty, 20 tons of terra cotta, 100 tons of structural steel, 30 tons of miscellaneous iron. There are 30,000 square feet of roofing surface, requiring a total of 70 tons of materials just for the roof. Also, 5 carloads of materials for the heating system, 12 cars of insulation cork, 4 carloads of material for the electrical work, including 10 miles of wire, 9 carloads of refrigeration machinery, 8 carloads of glass lined milk tanks, and 3 carloads of ice cream equipment. There is also approximately 5400 cubic yards of excavation for basement footings, etc. In this modern sunlight factory there are over 5200 panes of glass, or approximately 12,000 square feet of glass.



"The floor area is approximately 65,000 square feet, three stories and a basement, also a two story garage building, and cabinet shop.

"The general plan of the building is as follows: On the main floor: engine and compressor room, filling room, hardening rooms, brick room, can washing and sterilizing room, milk receiving room, and shipping platform. On the mezzanine floor: the ice cream freezers and fruit storage room. On the second floor: executive offices, laboratory, mixing room, ice tanks and ice storage rooms. On the third floor: milk and cream rooms, evaporators, and general storage. On the roof: Ammonia condensors, water tank and cooling tower.

"The capacity of the plant is 6,250 gallons of ice cream and 75 tons of ice per day, with a storage plant for 6,000 tons of ice. The hardening rooms for ice cream will have a capacity of 25,000 gallons.

"Milk and cream are delivered from the farms and dairies controlled by the M. & G. Company to the plant in solid car lots, and delivered directly to the M. & G. siding. The milk and cream is then delivered to the milk receiving room where it is tested and inspected and poured into a weighing vat, and then pumped directly into the six 2,000 gallon glass lined storage tanks, which are located on the third floor.

"From the storage tanks on the third floor, the milk and cream flow by gravity to two 500 gallon tanks where the sugar is added. From these tanks the next op-

A GOOD BEGINNING IS HALF THE BUSINESS.

eration is through the evaporator, where the entire mix is boiled under a vacuum, thereby assuring an absolutely pasteurized mix, without developing a boiled taste.

"From the evaporator the mix runs into two 500 gallon glass lined pasteurizing tanks, and from pasteurizing tanks to an 800 gallon per hour homogenizer with 1½ tons pressure.

"From the homogenizer the mix is pumped directly over a surface milk cooler which cools the mix from 135 to 40 degrees. (This surface cooler is enclosed in an air tight room.)

"From the surface cooler the mix flows by gravity to two 2,000 gallon glass lined holding tanks, where it is ready for flavoring previous to freezing.

"From these holding tanks, there is a portion of it drawn off into one 500 gallon flavoring tank where the entire batch is flavored. It is now ready for the freezing operation.

"On the mezzanine floor the freezers are located. There are four 120 quart freezers, and each freezer has a capacity of 120 quarts every 10 minutes. They are the newest in design and construction.

"After the mix has been frozen, instead of emptying the freezers directly into warm packing cans and containers, the M. & G. Company has devised a new system of transferring the frozen ice cream. It goes from the freezers into a glass lined hopper. There is one hopper for each set of two freezers. This hopper is kept cool by refrigeration.

"The cream is now ready for the filling process, which is done under refrigeration. The room itself is large enough to handle the output of three times the number of freezers which are now installed, and in addition to that the brick cutting and ice cream packaging will also be done in this room.

"The filling operation is as follows: After the cans are washed and sterilized in the sterilizing room, they are transferred to the can filling room, which, as previously stated, is under refrigeration. These cans are pre-cooled before the ice cream is transferred to the cans, thereby assuring the elimination of many objectionable features of filling cool ice cream into warm cans.

"Both the freezing and the filling operations can be seen from the outside of the building, inasmuch as the freezers are in sight on the mezzanine floor, and the front of the filling room is insulated with three thicknesses of plate glass.

"The cream is now transferred to the hardening rooms, where it is thoroughly hardened ready for delivery.

"The Sales and Delivery Department of the M. & G. Company has 63 trucks and 21 wagons of the most modern type, together with 52 horses in use, developing a service and delivery most complete in every detail. In addition to the regular daily service for each route, a special delivery service has been inaugurated at intervals of every three hours, together with an all night service, which enables all dealers to be well supplied at all times.

The refrigeration system is the newest and most modern of its kind. There are four large ammonia compressors requiring 700 H. P. Synchronous motors to drive them. There is also to be considered the piping, brine coolers, ice tanks, condensors, etc. In the refrigeration system there are over 8 miles of pipe, and there are 30,000 pounds of ammonia required to charge the system, and one solid tank car of concentrated calcium chloride.

"The water supply comes from two artesian wells, each well drilled to a depth of 300 feet, and throwing 500 gallons of water per minute each. The water used for condensing the ammonia is used over continuously. At this point the one expensive item in the manufacture of ice and refrigeration work is practically cut two-thirds. The water used for condensing is pumped over a cooling tower and is used over and over again. The method of pumping the water from the wells is with an air-lift system. Two large air compressors are used, one electrically driven and the other a steam driven unit. The water is blown to the surface into a large collecting pan and is then throughout the building.

"The two boilers for pasteurizing, heating, etc., are of 150 H.P. capacity each, and the exhaust steam from the different steam driven units in the plant is used for making hot water for washing, flushing, etc."

It is a remarkable industrial achievement, in which the entire ice cream industry should take pride.

VANILLA CONTROL

STANDARD VANILLA AND BLENDS

IN every highly specialized industry the laboratory plays an important part. The laboratory makes possible exact buying and manufacturing, without which the highly specialized business does not prosper.

Just consider the importance of the laboratory in the ice cream industry. Crude materials are bought on comparative tests, milk components are bought on a definite fat-and-solids basis and the finished product has a fixed overrun and fat-and-solids composition. Nothing is left to chance. And only by such methods as this is it possible to strike a favorable balance at the close of the year.

Our business, just as highly specialized, if not more so, demands the same control. Crude materials are bought, subject to laboratory approval, processes are checked, and finally, the finished product is analyzed for constancy of composition. And just as the ice cream manufacturer by such methods gives fair value to the public so do we guarantee our products to the manufacturer at all times.

Let's Understand Gelatine

By L. O. Thayer.

A SUBSTANCE found in animal bones, tissues and membranes, whose distinguishing characteristic is that of dissolving in hot water and forming a jelly on cooling. It is insoluble in cold water, but absorbs five to ten times its weight, and is soluble in hot water.

What Are Its Characteristics?

Gelatine is the best and foremost example of non-crystallizable substances known as colloids. A colloid is an emulsifier or binder of different liquid elements. it may or may not have viscosity powers (egg whites have none), but it always makes emulsified elements smooth and even in density.

Gelatine is a food with little proteid content, but has a high carbohydrate value, almost equal to sugar, the best carbohydrate known. This gives heat and energy to the body, but does not build tissue.

Gelatine is assimilated by the stomach quicker and with less effort than any food known.

The chief value of gelatine as a food places it in a class by itself. It is a concentrated food sparer, being able to save from waste half of its weight of proteid; twice as effective as any carbohydrate. Thus its value in the daily diet far exceeds its cost, and we might say gelatine is the efficiency export of the digestive process. Its value in hospitals, medical and dietary work has been recognized for years, but with little real knowledge of the scientific reasons here given in outline.

How Gelatine Is Made.

A brief description of the scientific manufacture of gelatine will be necessary to show the extremely difficult operation of converting the natural gelatine from bone, skin and sinews into the finished product.

The operation of making gelatine occupies a period of a month to six weeks, continuously day and night. The raw materials are treated in the vat for many days with a weak solution of pure muriatic acid, to remove the mineral matter, such as phosphate of lime, magnesia and carbonate of lime, leaving the gelatine bearing material intact. When the mineral matter is dissolved, the material is washed many times with pure filtered water, in order to remove every trace of acid.

The stock is then treated many times with lime water. This removes any fats that may be present, loosens the fibres, releasing the gelatine and purifying it. Then the stock is washed many times and is put into the boiling vat. Under constant and controlled temperatures the stock is boiled, which extracts the gelatine. The stock undergoes successive boilings, each succeeding, one under higher temperatures. As each run is made, the gelatine rises to the top and is drawn off. The first run always is the strongest, each successive run showing skimmings of less jelly strength.

The drawing off is transferred to vats in a cooled room where the thin mass congeals. It is then cut into sheets and placed on nets over wooden frames. These frames are put into a long alley into which is introduced a strong current of hot, dry air. This removes the greater part of the moisture in the sheets. Then the sheets go into the grinder, from which comes the granulated gelatine, ready for use.

The process is now completed, except for the important work of testing and grading. Each run is tested by several chemists, independently for chemicals and bacteria. In order that any errors or carelessness in the operation may be discovered, these tests are severe and carefully checked. The plant has its standards of purity, strength and bacteria, to which the product of every run must conform to a hair. Each skimming must meet the strength test of a similar skimming for many previous runs. When the results are verified, the grading is done and the ground gelatine packed into tight barrels and placed in a cool room for storage.

Legal Regulations for Gelatine.

The United States is the only nation that has a definite legal regulation for the purity of gelatine. The allowances by law for chemicals in gelatine are considered severe in other countries; but the purity of gelatine made and sold under this law has improved to such an extent in the last ten years that the gelatine factories now are prepared to, and do, manufacture a product far purer than the law. With one exception, the foreign gelatine houses do not care to meet the United States standards, selling at home only.

The Uses for Gelatine.

Gelatine is used in ice cream, for table desserts, in marshmallows, in candy lozenges, in druggist capsules, fountain toppings, by bakers for icing and fillings, in canned meats and sausages, and sometimes in fruit jellies. All these are considered as food uses. There are many technical uses for gelatine, like films, straw hats, etc.

There is more food gelatine used in this country than all the rest of the world put together. Perhaps England, Canada, France and Germany follow in this order.

The most important outlet for gelatine is ice cream.

Probably 90 per cent of all commercial ice cream contains gelatine. It has been used for 40 years and almost generally for 25 years. More than ten million pounds are used in this important industry. Nearly five million pounds are used for table jelly. The candy business consumes nearly three million more pounds, and so it goes.

How to Buy Gelatine.

There is lamentable ignorance about gelatine in nearly every big industry using it in large quantities. Every gelatine man can agree to this statement. Many men handling the colloid know little or nothing about the scientific, chemical or analytical details of this most important article; consequently, they are unable to impart much authentic information to the buyer. There are comparatively few recognized gelatine chemists or analysts, as it is a peculiar specialty in itself. Even these confess to a limited knowledge at present, compared to what ought to be known about this colloid.

When the bureau of chemistry put into effect its regulations for gelatine, only two scientists in the bureau knew much about it. When told by gelatine plant workers that it would be hard to meet the conditions imposed—and almost impossible to do better than the allowances—there was no man capable of declaring that gelatine could be made purer than the law. Yet the purity progress in some gelatine plants has been remarkable, and the development of scientific details and manufacture in the last few years can be characterized by no less an adjective than "wonderful.

There is no longer any excuse for making any slipshod gelatine, and if a concern is not progressive enough to improve its product constantly, it will soon find its proper level.

Since the war forced up the price of gelatine, along with everything else, and the gelatine bills doubled, the big users have come to realize that they must know what they are buying and see that they get value received. There has been more critical buying in the last two years, than all the previous period of gelatine use.

There is a loud and insistent demand for all the gelatine information possible. It may be stated that the sources of information still are meager. The wisest gelatine sharps are in snug, fat jobs and keep their hard-earned data to themselves. It was only two years ago that the Association of Official Agricultural Chemists began to study gelatine, and this organization has yet to produce much light of a practical nature. Those with most knowledge of this article have dug, dug, dug until they are qualified to speak, perhaps more or less superficially.

The writer discovered ten years ago, in his intensive study of ice cream, that the manufacturers knew less about gelatine than any other ingredient, although flavors ran a close second. With the installation of laboratories, and the hiring of more or less capable and experienced chemists, the larger manufacturers have learned a lot about flavors, and are saving money and selling an improved product. This leaves gelatine in a class by itself as an unknown quantity.

The same statement goes for the candy, bakery and packing interests. The table jelly and capsule makers know more about gelatine than all the other trades combined. They have had to dig up information and conduct exhaustive and costly experiments.

The first advice on buying gelatine is to know what you want it for. That may sound fanciful. Of course, a buyer has certain definite ideas about why he uses gelatine, but he must go beyond that and know just what characteristics the gelatine should have for his particular use. That entails study, and study is what

every gelatine buyer needs, if he is to save money and gain satisfaction.

It may be stated off-hand, that gelatine buying in the past has been confined to two points; that buyers could be put into two classes—strength buyers and price buyers. The personal or friendship element has entered more or less into both classes of buying. The buyer on strength has advanced a step over the price buyer. Recently there has been another advanced step noted, and the strength buyer has gone into comparative tests for strength, purity and bacteria. Under this system, if the friendship element is eliminated and the purchase be on a cold dollar and cents basis, the buyer has reached the point where he will get value received, and the obviating of gelatine worries.

The strictly price buyer—he always buys the cheapest—has no hope of satisfaction as long as he continues this policy.

Methods of analysis for purity are now available for any laboratory worker, and a simple jelly test strength is as good as the more complicated. The bacteria test can be performed by any good milk chemist.

In certain trades, clarity is a prime consideration, and every buyer needs to be assured of absolute uniformity. Each consignment upon arrival should be tested against the original sample, for strength, as a matter of self-protection and in order not to disarrange the formula. It is a wise buyer who demands an analysis of the gelatine he buys, and he should make an independent analysis to check up the seller's claim.

It is surprising what satisfaction has resulted in ice cream and candy trades from using a sterile gelatine. No ice cream manufacturer wants to introduce a concentrated mass of bacteria into a mix. He has spent thousands of dollars to keep them out. Gelatine is a media that hatches bacteria quicker even than milk. With bacteria eliminated there, his count is sure to be reduced greatly.

Bacteria in marshmallows causes the formation of gas, and this makes the goods unsaleable. The candy will taste sour or the gas destroy the texture and flavor. Every marshmallow maker heretofore has experienced this trouble in hot weather.

Keep bacteria out of your product by every means possible.

Later on we will give some definite rules for buying gelatine for your particular product, noting the characteristics needed. At this time a simple test will be given in order to determine strength and bacteria.

Weigh carefully one-half ounce of gelatine from each sample; put each portion into a beaker or tumbler holding a pint of cold water; put identifying numbers on the outside of glasses. This makes a 32 to 1 solution—quite weak—and weak enough to prevent low strength gelatines from solidifying. Put the gelatine powder on top of the cold water and let the glasses stand for 15 minutes. Then put the glasses into a bath or double boiler and turn on the heat. By constant stirring the gelatine should dissolve before the water in the bath reaches a temperature of 140 degrees. When the solution is clear and no traces of particles of gelatine can be seen, put the glasses into a refrigerator or entry of the cold room. The stronger gelatine will solidify first.

When the jelly is set, take the glasses out into a well lighted room. Note first the difference in clarity, color and clearness; then with the fingers press down on the jelly from glass to glass. The degree of resistance to pressure will give the comparison in strength. One can become quite expert with a little practice. A real expert can tell the difference to a fifth of a grade,

and that's as close as the most complicated of mechanical or polariscope devices can come.

For the simple yet conclusive bacteria test, just allow these glasses of jelly to remain on top of your desk, covered up, and examine them twice a day. In holding the glass between you and the light, you will see, in most gelatine, little white spots in the jelly. They are bacteria developing.

In some gelatines these colonies can be detected in six hours. This indicates a gelatine containing many millions to the gram. It is very bad, as the bulk of these bacteria are B. Coli. A gelatine may go twelve hours before showing signs of colonies. This means a bacteria content of perhaps five million to the gram. If a sample is clear up to twenty-four hours, it means three million, roughly; if good for thirty-six hours, it means two million.

As you examine the glasses from time to time, you will note that the growth of colonies has a marked effect on the solidity of the jelly. By shaking the glass you observe that the jelly is rapidly turning to liquid, meaning by this that the strength of the gelatine is being eaten by the bacteria. Who wants to buy a gelatine that cannot hold its strength until your goods are on the market?

Gelatine Value in Ice Cream.

Strange as it may seem to some, the ice cream industry cannot be classed as a whole when it comes to advice on buying gelatine. That is; what would be a proper brand and grade for a manufacturer in Seattle. for instance, might not do for a manufacturer in New Orleans.

It is true that all ice cream manufacturers require gelatine for the same purpose, viz: as a binder, smoother and stabilizer. Climatic conditions, mix conditions, and selling conditions, vary so that one cannot advise universal buying of one particular grade of strength.

If the plant is in a section where the summer heat is moderate, never above 80 degrees, one can use a weaker grade gelatine with satisfactory results. If the plant is in a section where the heat is excessive and of long duration, the strongest gelatine procurable is the only grade to use. Heat causes a softening of ice cream and when it softens the mass will slump. We will find this true in hot cities even when the best of care is taken in icing up the cabinets. Now a real strong gelatine will hold up ice cream after it softens, better than any other one thing. The stronger it is the better will the ice cream hold up. This fact is not generally known.

If in the mix the total solids content is above 35, a weaker grade gelatine can be used—aside from climatic and sales conditions. The lower the total solids content, the stronger should be the gelatine. You can see this quickly by realizing that the more water in the mix the more work is there to do for gelatine. Let us qualify this statement a bit, for fear someone may be misled. If you make a mix high in solids and use sweetened condensed, or a heavy condensed in large proportions, you will get "sandy" ice cream, which we hear so much about. In this case, a super-strong gelatine in larger quantity must be used. Recent experiments have shown that even a great proportion of sandiness caused by milk sugar in excess, mainly, can be overcome by using five ounces of a very strong gelatine. A weak gelatine cannot stop five per cent of sandiness under these conditions; a super-strong gelatine can stop seventy-five per cent.

The use of gelatine in preventing crystallization in ice cream shows that it forms a film around each icy particle. We all know that water tends to freeze in tiny crystals. The gelatine makes of each crystal a capsule, and if the film is thick and strong enough, the icy bit will get past the palate and tongue before melting. This is called smooth ice cream; that's the kind all are hopeful of producing.

If your product is sold in gallon, two-gallon and sizes smaller than five-gallon cans, the quicker it will be sold in each place. Then a weaker grade of gelatine can be used. If you sell nothing except fives and tens, which necessitates icing one or more days, you need a strong grade to prevent crystallizing.

If you ship for long distances and in a section like Fresno—from which the good Lord deliver us—where the temperature flirts with the top of the glass, the strongest gelatine made is none too good. Any big shipper should be careful of his gelatine strength.

So much for purity, bacteria and strength. It is feared that there may be some hesitation as to knowing just what to do about strength. To summarize this: If in doubt buy a stronger grade. It will do you no harm and for other reasons will improve your product. By using two and one-half ounces to the batch in winter ice cream, and three and one-half ounces in summer, of a strong grade, you will be able to meet all conditions not abnormal. It is wisdom to use less amount of a strong gelatine than six ounces of a weak grade.

If you are buying the best gelatine, don't let anyone get to the public with such worn-out ideas as Dr. Wiley nurtures—that it is a "filler," and "adulterant," and "aid to air-blowing" or a "stretcher." Several newspapers this summer have had such fool articles. If you are not afraid to carry home a half pound occasionally for a table jelly—and you could eat no dessert with more profit to yourself—then let no one attack your gelatine.

CP Horizontal Refrigerating Machine

An Over-Strong Refrigerating Machine

The ***CP* Refrigerating Machine**, in both horizontal and vertical types, is built over strong in every wearing part and extra heavy throughout. Our 25 years' experience in building refrigerating machines for the ice cream industry has taught us that the demands on the refrigerating machine in the ice cream plant are unusually severe and only an over-strong machine will stand up year in and year out.

That the ***CP* Refrigerating Machine** does give satisfactory service in the ice cream plant in spite of the varied and arduous requirements, hundreds of ice cream plant operators will testify.

ICE CREAM MAKING MACHINERY
REFRIGERATING SYSTEMS
DAIRY MACHINERY AND SUPPLIES

ADEQUATE REFRIGERATING MACHINERY PREPARES FOR THE SEASON'S RUSH.

A strong gelatine will give a creamier, smoother and more uniform composition to the mix.

Too much gelatine can be used in a mix; too much makes a gluey, sticky, product. Rather cut down the gelatine content. If you can use 15 pounds instead of 22 pounds to the 400-gallon mix, you will get all the best characteristics of a strong gelatine, and the product will taste lively and roll down the gullet in a delicious trickly that brings the eater one step nearer paradise.

Prepairing Gelatine for Ice Cream.

For many years gelatine has been prepared with little variation in ice cream plants, and the method generally employed has fallen short of the best results. In small plants the gelatine has been weighed for the batch; then it was soaked in cold water for thirty minutes; then the can containing the gelatine has been immersed in a cold water bath and the steam hose stuck in. While the water was being heated, the dissolving gelatine is stirred. When showing clear and with no lumps or particles, the gelatine was known to be ready for the mix. The only variation has been dissolving in warmed milk in order not to change the standard of the mix. So far this crude method has been all right if the temperature of the bath has not risen above 150 degrees.

The large plants have used a double kettle or special gelatine mixer, in order to save time. This, too, has been all right.

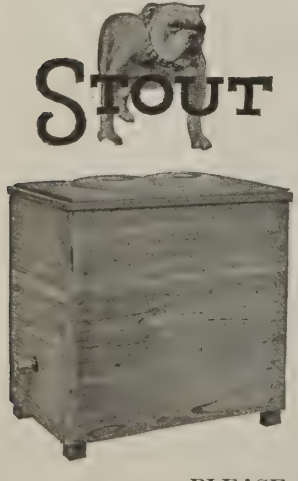
If the gelatine liquid has been poured into a vat of cold mix, then a wrong method has been pursued, for an incomplete emulsification has resulted. The warm gelatine should be put into the warm mix just after pasteurization has been completed. Then run through the homo. The gelatine can do its full work, and it will be mixed evenly throughout the mix.

The new idea of pasteurizing and homogenizing the whole mix has brought up another question in preparing gelatine. I was asked about this by several concerns, all anxious to do the right thing, as there seemed to be a sharp difference in opinion among gelatine men; and the only way to settle it was to go through a series of experiments. The problem is now settled.

When the pasteurizer is filled with the mix ingredients, and still cold, sprinkle the required amount of dry gelatine on the top. The finer the mesh the better. Give 15 minutes for the gelatine to soak before turning on the steam. The agitation, of course, will aid in soaking, and with the coil or paddle of the pasteurizer working the time for soaking can be cut down to five minutes. The gradual heat applied in the pasteurizer will give a perfect cooking for the gelatine. If there is no time to be lost, soak the gelatine for fifteen minutes outside the vat and pour in when the heat is first turned on.

There can be no doubt that this is the ideal method in large plants for introducing gelatine, and the full value of the colloid will be extracted.

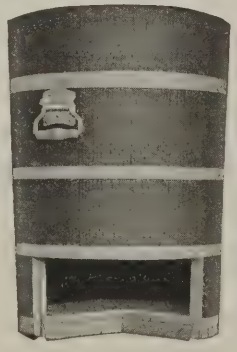
A MALE AND A FEMALE.



The story is told of early Chicago that, when the present fine system of parks was begun, one of the city fathers did not understand about the gondolas or Italian boats for the little artificial lakes. He had never seen a gondola. "Gondolas may be all right," he said, "but why be in such a hurry to buy a whole flock? Why not get a male gondola and a female gondola, and let Nature do the rest?"

Some people expect too much of Nature. She puts a hard shell on the nut to make it keep till sprouting time. She does up the orange in a water-proof wrapper. They were intended to stand some exposure to the elements. Milk was not. It was intended to pass directly from the producer to the consumer, from the mother to the young animal, without ever coming in contact with the air. The minute it does come in contact, even going from the udder to the milk pail, and even if no particles get into it, except from the air, it is tainted. That's why it needs to be pasteurized and sealed in sterile bottles. Nature doesn't make milk bottles or gondolas.

Other people lean the other way. They think they can beat Nature at her own game. There have been experimenters who thought they could make some kind of jelly and put life into it, but so far life has come only from life. Now speaks up Mr. Ford, who doesn't propose to make life but he proposes to make a "tin cow." That is, he proposes to make a machine that will make milk from certain raw materials.



Some people expect too much of Nature and some appear to think her works are easily duplicated.—The Milk Salesman.

CONDENSED AND EVAPORATED MILK MARKETS FEATURED BY DULL SUMMER DEMAND.

The same relative inactivity which featured condensed and evaporated milk markets for several months previous continued during July, and prospects for any materially improved demand are so slight that many of the trade who have held a more or less confident attitude are beginning to lose some of their optimism. Export demand, upon which canned milk manufacturers have come to depend to a large extent as an outlet for surplus domestic production, has become less of a factor each month. Buying for relief purposes, which constituted such a support especially to the evaporated milk market, has practically ceased, and no additional orders seem to be in sight. Domestic demand in England is reported as somewhat heavier, but American manufacturers have as competitors an increasing number of European factories which are able to lay down the goods at a lower cost and consequently get the business. Except for brands which are widely known through extensive advertising, foreign demand is not expected to absorb very large quantities of American made goods in the very near future. Latest export figures are for the month of June and indicate a slight decrease under May and quite a heavy decrease under June, 1921.

Surplus Milk Goes Into Butter and Cheese.

Condenseries, however, have had at least one favorable condition during the past few months which has helped considerably to offset the dull demand for canned milk. Prices of both butter and cheese have been such that it has been possible to divert surplus milk into one or the other of these products, and as result the production of condensed and evaporated goods has been held as low as was consistent with good business practice. These outlets have been fortunate not only because of the lighter demand which has featured both condensed and evaporated milk markets, but because of the upward tendency of costs of manufacturing. Seasonal advances in prices of raw milk are practically at hand, and in the case of condensed milk, sugar is over a third higher in cost than it was in the spring. The latter has been of considerable influence in divesting trade demand to evaporated milk on account of the lower prices at which this class of goods could be sold.

Light Summer Demand From Ice Cream Manufacturers.

The summer demand from the domestic trade for condensed and evaporated milk has not been up to ex-

CONDENSED AND EVAPORATED MILK MARKETS FEATURED BY DULL SUMMER DEMAND.

(Concluded from page 124)

pectations. The ice cream trade especially has taken far less quantities of goods than condensing firms had anticipated. This is explained partly through the fact that powdered milk is being more widely used in the manufacture of ice cream, and also because of the relatively cool summer which has featured various consuming sections of the country.

Summarized figures from manufacturers indicate that condensing operations have been carried on conservatively and that due consideration has been given to the anticipated and actual dull summer demand from all classes of trade. While total stocks on July 1, as indicated in the accompanying tables, reveal a moderately heavy increase over June 1, it must be borne in mind that this date followed closely upon the heavy producing season. It is to be noted also that while total stocks on July 1 were heavier than on the first of the previous month, unsold stocks were lighter. A comparison of total stocks July 1 this year and last shows a decrease of about 26 per cent. Therefore, from the statistical standpoint, markets were perhaps in better shape on July 1 than they were June 1.

PROF. BAER'S INQUIRY DEPARTMENT.

(Concluded from page 16)

use any extra milk serum solids, but I am suggesting below, in table two, a general formula, using about 2 per cent extra serum solids. I presume you are familiar with the calculations of butterfat and solids, but if you have any difficulty in figuring out the ingredients of your mix, I shall be glad to assist you in this matter if you will give me the composition of the ingredient you intend to use.

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	.....	.....	13.30
.5 lbs. gelatine	.....	.....	.47
85.5 lbs. milk and cream	14.0	6.36	20.36
100.0 lbs.	14.0	6.36	34.13

85.5 = 41 lbs. 30% cream and 44.5 lbs. 4% milk.
85.5 = 58 lbs. 25% cream and 27.5 lbs. skimmilk.

or

Table Two.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	.....	.....	13.30
.5 lbs. gelatine	.....	.....	.47
2.0 lbs. skimmilk powder	.....	1.9	1.9
83.5 lbs. milk and cream	14.0	6.25	20.25
100.0 lbs.	14.0	8.15	35.92

You stated in your letter that you were going to use a tub freezer and desired to connect the freezer with a brine pump and freeze with brine instead of salt and ice This makes a very satisfactory method of freezing. You should have a good centrifugal pump and have the brine at a temperature of eight or ten degrees F. while freezing.

Relative to the matter of using skim milk powder or condensed milk, we have found that either one will give satisfactory results. Many factories prefer to use skim milk powder and others will use condensed milk.

* * *

Dear Sir:—Will you please advise how I can increase my swell and do away with coarse cream to a certain extent. I have been using butter and straight milk with sugar and gelatine and find that my percentages have been as follows: Butterfat, 15 to 16 per cent; M. S. N. F., 5½ per cent; sugar, 13 per cent, and gelatine .05 per cent. I have been using Meloine, and freeze it as soon as cooled and thickened. A few times it has set around several hours because machinery would not work good but could see no noticeable difference. After pasteurizing and emulsifying milk, butter and sugar, I cool and mix gelatine and powder at once. Giving it about 30 minutes to age before starting to cool. Do you suppose it would help much to hold it cold for a few hours before adding powder and gelatine and getting ready to freeze. How much do you suppose it would help if I increase the milk solids not fat to about 9 per cent with powdered skim and cut the sugar to about 10 or 12 per cent. What percentage of milk solids not fat would you recommend with a 14 per cent butterfat requirement? E. W. P.

Reply: It appears from your letter that you have trouble in securing a satisfactory overrun and that you also have some coarse ice cream. Both the unsatisfactory overrun and the lack of smoothness in your product is due to the freezing of your mix too soon after processing. I am sure if you could see your way clear to hold your mix at least twenty-four hours, preferably forty-eight hours, before freezing, you would not only get a satisfactory swell in your product, but you would also get a much smoother cream. You might improve your formula by reducing the butterfat content to 14 per cent and the milk serum content to 8 per cent with skim milk powder. I would not reduce the sugar content, but leave that 13 or 14 per cent.

I am sure with these suggestions you will be able to improve your product a great deal but if you have further difficulty, I shall be glad to hear from you again.

* * *

Dear Sir:—Our ice cream mix has 11 per cent butterfat, 26 per cent solids. Total solids, 37 per cent; sugar, 13 per cent; gelatine, .5 per cent.

Ice cream is not as smooth as we desire. Will powder (give name and per cent) and improver give this result? J. H. S.

Reply: We have your letter of recent date stating that you have trouble in securing a smooth ice cream. You stated also that your mix tested 11 per cent fat and 37 per cent total solids. I see no reason why you should not get a smooth kind of ice cream from this mix and do not believe it will be necessary to use any improvers to get this result. Your trouble may be in not ageing the mix properly or in not carrying out the process of freezing correctly.

I suggest if you continue to have this trouble that you write to me again telling me just how you make up your mix and explain also how you carry out the freezing process. With this additional information I can locate the trouble.

* * *

Dear Sir:—Will you please tell me the analysis of the following mix, and what changes to have 100 per cent overrun: Eight qts. 22 per cent cream, 2 qts. whole condensed sweetened milk, 3 qts. whole milk, 3 lbs. sugar, 1 oz. Talbo powder, 1 oz. vanilla powder. F. S.

Reply: You will find below, in Table One, calculations showing the per cent of ingredients in your mix:

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
8 qts. or 16.6 lbs. 22% cream	3.65	1.16	4.81
2 qts. or 5.5 lbs. condensed	.41	1.4	4.00
3 qts. or 6.5 lbs. 4% milk	.26	.56	.82
2 oz. powdered vanilla	.....	.....	.....
3.0 lbs. sugar	.....	.....	2.85
31.6 lbs. mix.	4.32	3.12	13.48
Per cent	13.6	10.0	39.5
Per cent sugar	16.5	.....	.....

If I should criticise your mix I would say that the total solids were too high due to too large an amount of sugar. This large amount of sugar lowers the freezing temperature and makes it more difficult to freeze, and consequently the overrun does not come as easily as if you had a smaller amount of sugar. I am suggesting in Table Two a fifty pound mix which I would like to have you try. If your process of freezing is carried out correctly you should have no difficulty in getting 100 per cent or better overrun.

Table Two.

50 lb. mix for 11 gallons of ice cream—100% overrun.

Ingredients	Fat	Serum Sol.	Total Sol.
3.80 lbs. sugar	.....	.....	3.61
.25 lbs. or 4 oz. gelatine	.....	.....	.23
8.00 lbs. sweet condensed	.64	2.16	6.00
27.00 lbs. 22% cream	5.94	1.89	7.83
11.00 lbs. 4% milk	.44	.94	1.38
1½ oz. vanilla powder	.....	.....	.....
50.00 lbs	7.02	4.99	19.05
Per cent	14.0	10.0	38.0

I shall be glad to have you write me telling me what results you have obtained.

Derycote
PAINT YOUR PERSONALITY ON YOUR PACKAGES

After Dog Days

is a brilliant elastic colored enamel made especially for Dairy and Ice Cream service

Handling or transportation will not cause it to chip or crack. Hot or cold water, salt, ice, brine, washing powders, etc., will not dim its lustre or impair its protective qualities. Made in 24 colors, as well as black and white or in your standard shade if our regular colors don't suit. Write for our color card and ask for a sample.

None too early to get ready for tub and can painting.

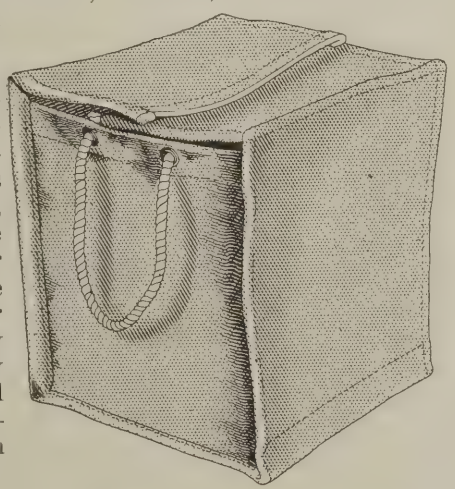
Best time to test out Derycote — *economy* and *service.*

Cheap price alone means *neither.*

Nor a high price, either.

Derycote means *real economy* and *service* at a *fair* price. Derycote *brilliance* is a by-word with those who *value* the *appearance* of their tubs and cans from an *advertising* standpoint.

Derycote Endurance and Covering capacity more than offsets its slight difference in first cost, to say nothing of its *final saving* in repair and replacement expenses.

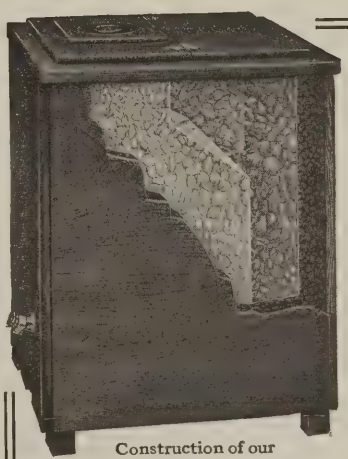


Write NOW for sample of Derycote, stating color, or place a sample order under our money back guarantee.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN MEMBER

THE NATIONAL PAINT and VARNISH COMPANY
CLEVELAND, OHIO, U. S. A.

THE "I-SAK" CARRY OUT PAIL.



A canvas pail for carrying ice cream is the product of the Alsak Corporation, Yonkers, N. Y. One of the arguments in favor of this package is that an imperceptible escapement of moisture through the canvas sides causes constant coolness, thus causing the ice to last longer and permitting the use of a smaller quantity. They are made in any size desired and require little storage space when folded.

HOWARD BLACK LOSES HELPMATE.

Just as we go to press news reaches us that Mrs. Howard Black, good wife of Howard W. Black, popular representative of the Widlar Co., Cleveland, Ohio, died on Friday, Aug. 4th. Two children, a boy and a girl, are left motherless. Mr. Black's many friends will learn of his loss with sorrow.

Don't worry, they haven't started to pay ice cream makers bricklayer's wages yet.

Construction of our "ZERO" Brick Cabinet

100% Refrigeration

In thousands of stores the country over Grand Rapids Ice Cream Cabinets are demonstrating year in and year out that it pays to use the **best** equipment made.

In these superior cabinets only the finest of insulating materials are used. Our special manufacturing process (which takes full advantage of the scientific principles governing refrigeration) insures the effectiveness of these materials. Workmanship of a type that is rare outside of the world's furniture center adds much to the long life of **Grand Rapids Ice Cream Cabinets of Quality.**

Investigate. You will find that it costs no more to install cabinets guaranteed to provide 100% refrigeration than it does for less efficient cabinets. Further, you will learn how this refrigerating efficiency brings about several important year 'round economies.

WASHINGTON — MAINE

News From Far and Near

CALIFORNIA — FLORIDA

Fairhope, Ala.—A new farmers' co-operative creamery recently begun operations here, manufacturing ice cream, butter and cheese.

Tucson, Ariz.—A new plant for manufacturing ice cream and similar products is about to open for business. B. T. Davis and F. E. Somarindyck, recent arrivals here, are the members of the firm which will be known as the Tucson Purity Ice Cream Co. A large quantity of machinery has already been brought to Tucson and installed in the company's location. All of the equipment is of the most modern type and no expense is being spared to provide for perfect sanitation and cleanliness.

Santa Ana, Cal.—The Excelsior Creamery Company has just completed a new and modern plant. New machinery has been installed, an ice plant added and the business enlarged generally. One of the features of the new equipment is the fact that all vats are lined with glass. The ice cream freezing equipment will produce 3000 gallons daily. Twenty-six trucks will be maintained and repaired in the large completely equipped garage and machine shop which is adjacent to the new plant.

Santa Rosa, Cal.—Gustaf Swanberg, manager, and S. Harrison, assistant manager of the Acme Ice Cream Co. of San Francisco, announced during a recent visit here that plans for establishing a branch plant in Santa Rosa are completed.

Chicago, Ill.—The Bowman Dairy Company has purchased the two-story building on Erie Street, which they have heretofore occupied under lease.

Angola, Ind.—E. E. Spade, proprietor of the Angola Ice Cream Company, has increased the efficiency of his plant by installing a refrigeration plant.

Lafayette, Ind.—The Chamberlain Ice Cream Company is constructing a new brick and concrete factory here, with two stories and full basement. The new plant is to be modern in every detail of construction and equipment and will be completed within a short time. L. M. Ellis is president, L. H. Balfe is vice-president, and W. C. Coffroth is secretary-treasurer of this company.

Sullivan, Ind.—Edsil and Claude J. Bostick, of this city, have bought the plant of the Sullivan Ice Cream Company and plan to improve it.

Chariton, Ia.—The Chariton Ice Cream Company, lately incorporated for $35,000, bought the Douglas Ice Cream Company.

Estherville, Ia.—The Hutchinson Ice Cream Company has bought the ice cream manufacturing equipment from F. H. Graaf.

Muscatine, Ia.—Leu & Stein, ice cream manufacturers, have moved to their new building, recently erected.

The new plant, a two-story structure, is modern in every respect and is said to have a capacity of 1,000 gallons of ice cream a day.

Miller, Ia.—The Miller creamery reports the shipment of four cars of butter during the month of June and an unusually large ice cream business.

Shenandoah, Ia.—George Louie, proprietor of the Dairy Store, plans to extend his ice cream and butter making business within the next few weeks. He is at present unable to make enough ice cram and butter to supply the local demand and will install additional modern machinery which will enable him to meet the demand and supply new business.

Kingman, Kans.—The Beatrice Creamery Company has purchased the business of the Kingman Ice and Creamery Company here, and will build a new $15,000 plant, construction of which is to begin soon and be finished by the first of next year.

Marlboro, Mass.—A $50,000 organization, to be known as the Marlboro Co-operative Creamery Company, is being organized here for the purpose of handling the surplus market milk in the producing districts of neighboring large cities. It is proposed to start a large ice cream factory and manufacture ice cream

Baltimore, Md.—L. Rosenfeld, a manufacturer of ice cream factory equipment, is planning the erection of a one-story brick addition to his plant to cost about $18,000.

Butler, Pa.—The Rieck-McJunkin Dairy Company, an ice cream and dairy plant, remodeled here at a cost of about $50,000.

Flint, Mich.—The Detroit Creamery Company is contemplating the location of a branch plant in Flint, according to C. B. Burr, state manager for the company, who was in Flint recently. It is the plan of the Detroit company, he says, to manufacture butter and ice cream here, besides establishing a milk route. The Detroit Creamery Company has plants, including condensaries, in several southeastern Michigan cities.

Miles City, Mont.—The Western Creamery Company's local plant, which opened early in June, now has a capacity of 50,000 pounds of butter a week, according to Manager F. R. Merrill, who also reports that a large quantity of ice cream is being turned out daily.

Carthage, Mo.—A new wholesale ice cream business has been launched in Carthage by the Carthage Ice & Cold Storage Company, which has completed the installation of equipment and now has the ice cream plant in operation. M. C. Allegeier is in charge of the new branch.

Kansas City, Mo.—After overpowering two employes, two bandits robbed a safe in the office of the Purity Ice Cream Company here recently, taking $1,400.

Marysville, Mo.—The Jersey Ice Cream business is now open for business in Everhart Ice Plant Building.

Rochefort, Mo.—James Grossman has bought the ice cream business of Joseph Cowden.

Troy, N. Y.—One of the most up-to-date ice cream plants of the smaller type to be found anywhere has been started in Troy this summer. H. E. Wagar is owner and manager. The chief equipment of the plant consists of two 300-gallon mixers and holding vats, a viscolizer and two freezers equipped with batch measures.

Greensboro, N. C.—The Arctic Ice and Coal Company have lately installed new machinery consisting of three 80-quart freezers, a 600-gallon mix tank, and a 900-gallon increase in storage tank capacity.

Raton, N. M.—The Raton Creamery Company has just completed the installation of a large quantity of new equipment, including a six-ton refrigerating plant and a hardening room with a capacity of 600 gallons. The plant now has a capacity of 1,000 pounds of butter and 100 gallons of cream per day, and the cost of the new equipment will run over $11,000.

McConnellsville, O.—Geo. W. Hughes, a local citizen, has purchased the necessary machinery for the manufacture of ice cream.

Newkirk, Okla.—Newkirk has an ice cream factory, or rather it has a branch of a Ponca City concern, the Ponca City Milk and Ice Cream Company. The branch here will be known as the Midwest Creamery Co., and C. C. Shidler is the local manager.

The capacity of the factory is 300 gallons of ice cream or sherbert per day. They will sell the product both at wholesale and retail.

Altoona, Pa.—Permits were issued recently to a contracting firm for the erection of the last of the group of buildings that will comprise the completed plant of the Caum Ice Cream Company at Fifth Avenue and Ninth Street.

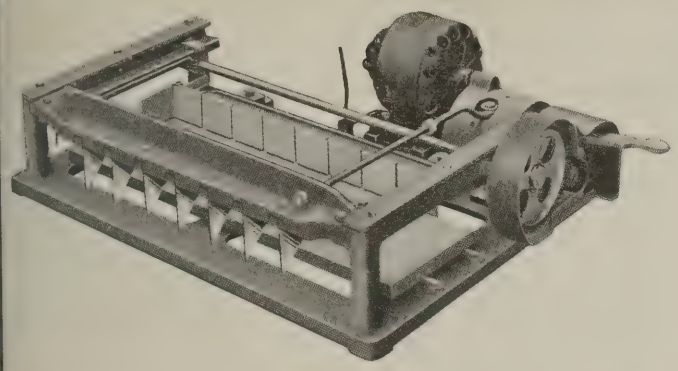
Brownsville, Pa.—Russell Thomas has resigned as manager of the Brownsville plant of the I. N. Hagan Ice Cream Company.

Chambersburg, Pa.—The Hershey Creamery Company recently purchased the local plant of the Cumberland Valley Creamery and Dairy Company. The plant will continue to manufacture ice cream and other dairy products under the management of Harold Fogelsanger, formerly manager of another Hershey plant.

Greenville, Pa.—Henry Hunsicker has leased part of a building and started making alterations for the installation of an ice cream plant.

Kittanning, Pa.—The Kittanning Pure Milk Company has installed a new brine freezer.

Oil City, Pa.—Earl E. Lesh and Fred L. Sherick, who formerly owned the milk business known as Lesh's Dairy, have sold out and are going to start in the ice cream business. The new concern will be known as Lesh & Sherick.



Portage, Pa.—The Nelson Ice Cream Company, which leased a building and began operations but a few weeks ago, now has a capacity of more than five hundred gallons of ice cream daily.

Reading, Pa.—The Reading Ice Cream Company, located at Tenth and Greenwich Streets, has made extensive improvements to its plant.

Sunbury, Pa.—That the ice cream business has increased 500 per cent in two years, dealers in this territory recently asserted to be their belief.

Breckenridge, Tex.—The Dillingham Ice Cream Co. will build a new ice and cold storage plant with capacity of about 65 tons per day.

Wichita Falls, Tex.—The Peoples Ice Company is planning the addition of an ice cream factory to their present ice manufacturing and storage business.

Power Drive Also

The R & D Better Brick Cutter with automatic power drive is *by far* the fastest brick cutting machine sold today. It costs less than any other power driven machine too. Guaranteed and sent on trial.

Wolfhounds

J. WILL CARPENTER, Pres.
Haines-Carpenter Dairy Products Company, St. Louis, Mo.
OTIS B. WITTE, Secretary
N. A. Kennedy Supply Company, Oklahoma City, Okla.

Thanks for the nice things you said about me, also for the picture of the babies and myself, which appeared in the last issue of the Review.

And to think that in this same issue our handsome President's face was to be seen! It seems that wonders will never cease. Just as all the Wolf Hounds were about to give up the search for J. Will, up he pops, smiling his same old smile. It looks as if Bill hasn't a worry in the world. Wonder if he has been in Milwaukee looking over that wonderful new building of the Review's. From the twinkle in Bill's eye, one would think that perhaps our friends Olsen and Slater had taken him to their private cellar to look over samples of printers' ink (?). However, scout Bill was able to come out of the cellar shouting, "Look out for the Wolf Hounds this year! Be ready for the biggest time ever at this year's convention." Great words, Bill! Now that you have opened the campaign, we are all in line to push forward and make this the BANNER YEAR of all. Wolf Hounds, shout the big news along the line.

By the way, in your travels keep a weather eye open for our lost member, who has been missing for about six months. Last heard of him, he was headed north, trying to sell condensed milk to a burlesque troupe. (Shame on you, Fred, old scout! C. R. H. is the one to look after that bunch.) Boys, find him before convention, as things would be mighty quiet without Fred.

Boys, when in Kansas City, look up Carl Zimmerman. I think you may find them together, and perhaps Pete Miller, Jim Nelson, Frank Wright and Cutner are with them. If so, their absence will be explained, although I did think African Golf was banned during the summer months. Expect that I was mistaken.

Now, boys, remember that the writer is the chairman of the Wolf Hounds' entertainment committee this year, and wants to please you all, so if you have any suggestions to offer regarding the big show this year, write at once and tell me. Do not delay, as it takes time to arrange our entertainment, and can't be taken care of in a week. Remember, boys, "THIS YEAR BIGGER AND BETTER THAN EVER" is the word.

Yours with a boost,

C. R. HAUK.

SODA MENUS

Effective Advertising For Ice Cream Manufacturers

OUR menus are popular among ice cream manufacturers who give them to druggists and confectioners with the manufacturer's trade-mark or advertising slogan printed on them. This is a sure and inexpensive means of advertising the ice cream manufacturer as the menus come to the attention of the customers of the retailer.

These menus are **especially** for the Soda Fountain. They are not hotel menus nor restaurant menus, but are printed and embossed in colors on the highest grade of stock and reproduced from original drawings for the use of Soda Fountains exclusively.

Samples Free on Request.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

Continuance of Railroad Strike May Cause Sugar Shortage.

As yet, the railroad strike has not interfered to any appreciable extent with the shipments of sugar, but if it continues for the next several weeks, it may hamper the distribution of this and other commodities, particularly in view of the complications offered by the coal strike, and may operate to depress the raw sugar market, according to a recent statement in "Facts About Sugar," by a refinery traffic official who had made a careful survey of the situation.

It is generally accepted that unless signs of an early settlement of thestrike is effected, the government will extend its system of priorities to apply to the movement of all important foodstuffs, including sugar, which will mitigate conditions as far as these commodities are concerned. A condition which causes the situation to look serious is the fact that trade stocks at important jobbing centers throughout the eastern and central states are very low. Such cities as Buffalo, Cincinnati, Louisville and others that serve important sections were reported this week to be very short of sugar, and with most of the refiners oversold from four to six weeks, there appears to be little hope of an immediate remedy for the situation. Reports reached New York recently that at certain points jobbers were already limiting their distribution to retailers, but this seems to be occasioned rather by the difficulty in obtaining shipments from refineries than by lack of transportation facilities.

Cuban Stocks Low.

Havana, July 28.—A survey of the supply situation by a well informed member of the sugar trade leads to the conclusion that the balance of unsold stocks of the past season's crop left on the island probably is not more than 350,000 long tons. This is aside from stocks held by such companies as the Cuban American, United Fruit, Atkins interests, and others that have direct refinery connections that will absorb their sugars.

Knowledge of the fact that available unsold supplies have been reduced to very narrow proportions, coupled with reports that refiners in the United States are still in need of raw sugar, has lead to a very optimistic feeling among holders, who are anticipating higher prices on the balance of their supplies and are looking for four cents a pound and better.—Facts About Sugar.

* * *

The Demand for Sugar.

Anyone who had suggested six months ago that the supplies of sugar available in Cuba and the United States would be insufficient to meet the requirements of the American market throughout the year would have made himself an immediate candidate for inquiry as to his sanity, says "Facts About Sugar." This trade journal's prediction at the end of 1921 that the heavy carryovers then on hand would be absorbed during the year 1922 was generally set down in trade circles as an altogether unjustifiable display of optimism. Yet the majority of estimates appearing at the present time predict that importations of full duty paying sugars will be needed before the end of the year, a possibility that "Facts About Sugar" pointed out in its review of the situation published in June.

From January 1 to July 15 Cuba shipped over 3,900,000 long tons of sugar, states an article in a recent issue of this journal, a greater quantity than the total shipments for any full year prior to 1922. Not all of this has come to the United States, as direct shipments of raws to other countries have amounted to more than 1,000,000 long tons and exports of refined from the United States have accounted for more than 650,000 tons additional. Thus, Cuba's shipments destined for consumption within the United States have amounted to roundly 2,200,000 long tons.

Shipments from the insular territories of the United States, together with small receipts of full duty paying sugar, have amounted to roundly 700,000 tons during this same period, while the distribution of beet and Louisiana sugar within the country is estimated at a slightly larger quantity, making a round total of 1,400,000 tons from domestic sources and 2,200,000 tons from Cuba, or a total of 3,600,000 tons. Deducting stocks and afloats leaves approximately 3,300,000 tons, raw sugar value, distributed in six and a half months, or over 3,000,000 tons in terms of refined.

Where has all this sugar gone? Has it passed into consumption, or are large amounts held for speculative purposes and therefore still to be offered on the market? How long will the present record breaking rate of absorption continue? What are the factors that have led to the great increase in consumption, assuming that the sugars distributed actually have been consumed? These are questions that are being eagerly discussed by the sugar trade and the answers arrived at are factors affecting the course of the market.

As pointed out in our summary of distribution for the first half of the year, the amount of sugar passing into channels of consumption during that period was roundly sixty pounds per capita. While it is obvious that not all this sugar was consumed within this period, there is no evidence of any abnormal accumulation of stocks in distributors' hands. In fact, trade stocks are abnormally low in most parts of the country, owing to inability to obtain prompt shipment from refiners.

While considerable quantities of raw sugar were purchased by operators during the early months of the year, most of these apparently have been sold at good profits during the rapid rise of prices in the past two months. Stocks held for speculative purposes at the present time can hardly be of sufficient extent to exercise an important influence in the market.

The anticipation that demand from the distributing trade would show a marked falling off after July 1 has not been realized thus far. The call for sugar is as insistent as ever and most of the refiners are as far oversold as they have been for the past three months.

Of the explanations advanced to account for the increase in consumption the ones having the most valid basis appear to be the abundant crops of all kinds of fruits which have led to an unusual volume of home canning, the increased consumption of soft drinks and ice cream, the prevalence of home brewing, and the general improvement in the industrial situation.

For the remainder of the year available supplies from domestic production and Cuba can hardly amount to more than 1,750,000 long tons, even though we count on

(Concluded on page 132)

The Social Position of the Dairy Cow

"Remember You are Speaking to a Lady."

NO ONE will accuse the Dairy Cow of being a social climber, yet she has during the past twenty-five years advanced so rapidly in the social scale that a few words on the subject might be interesting.

It is not so many years ago, and quite within the memory of the last generation, that the cow was sort of an outcast. To say that she stood next to the horse does not mean very much. She was a necessary evil on the farm and in the large family of the small town, and anyone who could depend upon a small boy to drive the cow to pasture in the morning and to drive her home at night had license to have a cow; not that she gave much milk, but because there was no other way to get fresh milk.

The worst herd to be found anywhere today was superior in average yield to the milk cow of a generation ago and her unproductiveness was reflected in the treatment she secured at the hands of her master.

George F. Parker in a recent issue of the Saturday Evening Post gives us a vivid picture of the Dairy Cow of pioneer days. She was generally a small creature and had her calf to feed besides supplying her milk to many hungry children. Because of the poor quality and the small quantity of the milk these cows gave, every farmer had to keep several where now one would serve.

If she failed to breed within any given year, regardless of her past history, she was fattened and killed and her meat was distributed in the neighborhood to be eaten fresh or it was packed for summer use as corned beef.

The vicious cow was more common than she is today. Added to the occasional case of bad temper was the awful exposure to cold, heat, floods, insects and the brave struggle for forage. Worst of all was the carelessness or brutality of boys or hired men, or more frequently of cross, tired women with peevish children waiting impatiently for the milk while it was still warm. Almost uniformly the milking was done outdoors, without shelter for animal or human, and the cow suffering perhaps from an over-full udder which demanded relief, with teats cracked from the cold or torn by briars or by struggles in the brush when seeking food, was expected to bear the roughness of treatment from a coarse, freezing man or an ignorant learner, and then to stand, thus exposed and treated until the milking process was over.

There are still vicious cows to be reckoned with and there always will be, perhaps, and they will provoke brutal treatment from man, but the gentleness of the cow herself, her humbleness and good behavior, her productiveness, her part as foster mother of the human race, have won over mankind to a state where she shares in

Slogan of the 1922 National Dairy Exposition.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—St. Paul-Minneapolis, Oct. 7-14.

the affections of those who have her in charge. "Remember you are speaking to a lady," might well be placarded in the dairy barns throughout the country to remind the farm-hand of the present social position of the dairy cow.

The methods of gathering and saving the milk were formerly dirty and discreditable; in these days they would not be countenanced. It was collected in a way as primitive as in patriarchal days when men wandered with their flocks. There were of course exceptions. The really good, efficient farmer took the best care of his cows in the matter of shelter and food as well as in methods of handling and milking and cared for the milk and butter in cool cellars or wells or spring houses. In such cases the animals were afforded the same good housing provided for the horse, the money profit being multiplied many fold; but these cases were exceptional and the status of the average dairy cow was way below par.

Has the cow advanced the social position during the present generation? Attend the National Dairy Exposition and see what a change has come over man's attitude toward the dairy cow. A million dollar exposition of a billion dollar industry. Cows valued at many thousands of dollars each, curried and brushed and watered and fed by lackeys whose sole duty is to attend to the physical needs and comfort of "Bossy." Stalls and barn equipment almost fit for humans. Machinery for milk products that run up into the millions.

The automobile put our horse shows practically out of business, but can and will anything supplant the dairy show? Not as long as there are no worthy substitutes for milk and butter, and who knows but the time may come and soon—when ladies of refinement—social leaders—will consult with proper authorities in matters of dress before appearing at the Dairy Exposition. Verily, say we, the dairy cow has advanced her social position, and she deserves it.

NEWS ABOUT SUGAR.

(Concluded from page 130)

the distribution of the whole Louisiana crop and 80 per cent of the coming beet crop before the end of the year. This will permit a monthly distribution in the domestic market of slightly more than 300,000 tons, or less than 70 per cent of the rate of which distribution has proceeded during the earlier months of the year. This is a lower proportionate rate than usually has prevailed during the latter part of the year, but an important factor to be reckoned with, and one that apparently has been overlooked in most of the estimates recently published, is the brake which rising prices apply to the use of sugar. With sugar retailing at eight cents a pound the rate of consumption naturally will be materially less than with a price of five cents a pound.

Present indications are that a pinch in raw supplies may be felt during the latter part of August and the month of September, before the new crop of Louisiana and beet sugar comes upon the market. This may give an opening for the importation of full duty paying sugars, but we believe that various influences now at work, particularly the rise in prices, will check demand to some extent and that predictions of 15-cent sugar before the end of the year, such as have recently been heard, are premature. We trust that they will prove to be entirely unwarranted. Nobody who has the welfare of the sugar industry at heart desires to see a repetition of 1920.

GROTHE REFRIGERATOR BODIES NOW BUILT AT ST. LOUIS.

The John J. Grothe Co., Inc., main office and plant at Woburn, Massachusetts, builders of the Grothe refrigerator bodies, have recently established a building branch at St. Louis, Missouri.

The branch is located at 7th and Cass Avenue. Frank L. Ruzicka is in charge and will build Grothe refrigerator bodies under the supervision of the home plant.

Mr. Ruzicka is an old established and reputable body builder and well qualified for this work. All bodies built at the branch are guaranteed the same as if built at the home plant.

In regards to the St. Louis building branch, A. B. Mackay, general manager of the John J. Grothe Co., Inc., states:

"The work of the Grothe organization is to make possible the economical and efficient delivery of ice cream. Ice cream manufacturers everywhere are fast recognizing the invaluable advantages of refrigerator body delivery, it reduces and saves labor, conserves packing ice and salt supplies, and keeps the ice cream in perfect condition at all times. The Middle West ice cream manufacturers will now have the same advantage to put their delivery on an up-to-date, paying basis as the manufacturers in other parts of the country are now doing. It is the intention of the John J. Grothe Co., Inc., to place branches in Cleveland and Minneapolis in the near future."

LONDON GETS NEW FAD.

American Ice Cream Soda Has Reached There at Last.

Eight years ago there were perhaps a half-dozen ice cream soda fountains in London. Now there are hundreds. Signs everywhere: "American drinks served." One of the large department stores has a good sized room in which ice cream soda is sold. And we noticed that out of the 200 persons there was only one other who looked like an American. The manager told us, "At first the English people could not understand combining ice cream with a soda, because they said the soda was bitter. It was even ridiculed. But they drank it, and now it is growing more and more popular. Not only in London but in the provinces. They like the sort of bitter taste, and when we tried to put a little milk or cream in the ice cream soda when it was mixed, as you Americans do, they abjected to the milk and cream, saying that they liked the bitter taste. We serve all sorts of things in exactly the same way as the American fountains do, and we have all sorts of new combinations." We asked, "Do you sell chewing gum?" He answered, "To Americans only."—London Letter.

A CORRECTION.

In the July issue of The Ice Cream Review we carried a report of a visit of an Ice Cream Review representative to the Sessions Ice Cream Factory at Fond du Lac, Wis. In this article it was stated that they were using a Baker ice machine of 15-ton capacity which was actually operating at the rate of 18 tons. This was an error. The machine is a York of 20 tons and has been in operation at this plant for the last six years doing at least 25 tons refrigerating duty and running continuously 24 hours per day during the summer months.

You can get somebody to sell you anything you want if you use "The Ice Cream Review" Want Department.

Are You Prepared for an Opportunity Like This

WANTED—Experienced plant superintendent for large ice cream manufacturing plant on the coast. Must have practical experience and knowledge in the latest methods of ice cream mix and freezing. **Must know condensed milk thoroughly** as applied to manufacturing of ice cream. Must have the best references. This is a big job. Only capable men need apply. Address: R-265, Ice Cream Review. 4-22

This Ad appeared in the April issue of The Ice Cream Review. It goes to show that the "Big" opportunities are open to those with a thorough knowledge of subjects relating to ice cream making other than just being able to draw a satisfactory product from the freezer.

You can get a thorough knowledge of all the ins and outs of condensed, evaporated and powderedmilk from

Prof. Hunziker's Book

CONDENSED MILK AND MILK POWDER

Have a copy handy for ready reference. Much of the information therein can be applied in the conduct of present day ice cream manufacture. It gives you a better understanding of qualities and values of the goods purchased to make up an economical and trade getting mix.

NEW McCORMICK CATALOG.

"Modern Plants" is the title of a most interesting—and very beautiful—catalog just gotten out by The McCormick Company, Inc., dairy and ice cream plant architects and engineers, of Pittsburgh and New York.

In this book are shown plans and a group of modern dairy and ice cream plants into which convenience, efficiency, appearance, durability and economy have all been successfully embodied. All of these plants, of course, were planned and designed by them.

The catalog is remarkably valuable to the dairy and ice cream trade in that it shows exterior and interior views of many of the most prominent plants in the country.

The McCormick Company is to be congratulated, not only for its initiative in issuing the book—the first of its kind ever provided for the trade—but upon this handsome and elaborate method of presenting a comprehensive expose of their service and the wide scope of their architectural and engineering work, of which they may well be proud.

This catalog will be sent prepaid, upon request, to any dairy or ice cream manufacturer who may be interested in modern plants.

MEMPHIS TO HAVE LARGE NEW ICE CREAM PLANT.

The Clover Farm Dairy Company, with L. N. Larned as general manager, is planning the erection of a large dairy and ice cream plant at Memphis, Tenn., on the corner of Union Ave. and Walnut Street. Three units of the plant will be constructed at once, but the plant is eventually to consist of five units. The milk plant will be the first unit. The building will be of brick and reinforced concrete with three stories and basement, and will have a capacity of 60,000 quarts of milk, 4,000 pounds of butter, and 2,500 gallons of ice cream. Filling, pasteurizing and freezing rooms are to be finished in white tile, and the milk storage room will have its own refrigerating plant.

The power plant of the firm is to occupy a separate building also and will contain two 150-horsepower boilers and a 150-ton refrigerating plant. It is later planned to erect a separate ice cream plant and garage and wagon shed.

PICANINNY FREEZE.

"Eat seeds 'n all" is the friendly admonition to the purchaser of a dainty new ice cream confection put on the market under the trade name "Picaninny Freeze." It is a slice of ice cream shaped like the slice of a watermelon and the "seeds" are of chocolate. It is wrapped in wax paper and retails for five cents.

We got first hand information about it when the Mansfield Ice Cream Co., Milwaukee, sent over a basketful of the dainties to the Review office. They tasted so good we had to go and see them made. In the Mansfield plant they are being put out without coming in contact with human hands. "Picaninny Freeze" is surely something new again, and the Mansfield folks report a splendid demand.

FRIEND DIXON SUFFERS LOSS.

A brief note from A. E. Dixon, secretary of the North Carolina Ice Cream Manufacturers Association and vice-president and general manager of the Carolina Ice Cream Co., Fayetteville, N. C., gives the information that "a disastrous fire and chaotic conditions" keep him mighty busy. His many friends will hope for early normal conditions and a still bigger business.

BUYING TRUCKS ON A MONTHLY PAYMENT PLAN.

A very unique and practical plan for selling trucks on the deferred payment plan has been announced by the Commercial Truck Company of Philadelphia. Instead of trying to work out a plan which lays a burden on the buyer, thus compelling the thrifty buyer to disregard it, this new plan is made to appeal to all buyers. The terms are low, unusualy so, with ample time for the purchaser to pay for the trucks, a small first payment, and either no carrying charge or a very small one. The time payments are part of the regular terms and the company is quite as ready to sell on deferred payments to the responsible individual or company as they are to sell for cash. There are no special insurance requirements and the purchase of trucks and equipment under this plan in no way affects the buyer's credit. The deferred payment plan covers the chassis, battery, C. T. body and all equipment. Ten per cent of the purchase price is required with order and 10 per cent at the time of delivery. This leaves 80 per cent of the purchase price to be spread over 12, 18 or 24 months. Time payment plans are usually a thing that the manufacturer does not want to broadcast and wants to offer it only where it is absolutely necessary to get the business. The Commercial Truck Company is going at it just the other way and is quite willing to take all of their business on time payment if that is more convenient for the buyer.

CONFESSIONS OF AN ICE CREAM TUB.

"I am an old tub. I have worked many years; started business in Indiana and moved to Kentucky in my young days. The man who owned me died; and his wife used me many years. A corporation came along and bought me, and now I work every day and Sunday, too. In the old days when a hoop broke I was thrown aside in an out-of-the-way place, waiting for a cooper to come around. Those were lonesome times—lying in a pile of has-beens. It is different now; I go day and night. Sometimes I go to a swell drug store, then to a wedding, then to the Country Club. In the summer time I get to go to picnics and church suppers. Never an idle day; if a hoop comes off, anyone around the place picks up the Gilmour Wire Hoop Machine and puts a hoop on me, and I am ready for the next trip.

BELOW ZERO TEMPERATURE WITH SALT AND ICE.

A new folder just off the press describes the Grothe refrigerator body for ice cream trucks. It describes the construction of the different types of bodies and also gives the details of a test made at the Buffalo show last November in which it was proven that a below zero temperature with salt and ice is possible. In fact a temperature of 5.8 degrees Fahrenheit below zero was reached. A copy of this interesting folder will be mailed free to readers of the Ice Cream Review. Address John J. Grothe Co., Inc., Everett and Union Sts., Woburn, Mass.

"I heard the boss say the other day that since he got the Gilmour Wire Hoop Machine he does the same amount of business with one-third less tubs. I am sure glad he got one of those machines, for now I can do just as good work as any new tub."

The above communication by Old Tub was recently received at this office, and thinking it might interest other ice cream manufacturers like Old Tub's boss, we're passing the information on. A picture of Old Tub will be found in the Gilmour Hoop Machine Company's advertisement elsewhere in this issue.

ICE CREAM IN HEADLINES IN ADVERTISERS PUBLICATION.

That ice cream is coming in for its share of publicity is evidenced by the articles that have recently appeared in such magazines as the "Nation's Business" and "The World's Work" pertaining to the activities and ideals of the Association of Ice Cream Supply Men. Occasionally we see a bit of publicity in the "Saturday Evening Post," "System" or "World's Work," "The Geographical Magazine" and the city dailies, "Philadelphia Public Ledger," "New York Tribune" and many others.

Just recently in "Printer's Ink" was published an article about ice cream featuring the "orange crush" special flavors and their method of advertising and increasing the consumption of ice cream.

It reads as follows:

Orange-Crush Climbs Aboard the Ice-Cream Special.

New Uses for Beverage Flavors Create Broader Markets.

The consumer, be he ever so humble, likes to appear a connoisseur. And for the connoisseur nothing ordinary or commonplace will do. That is why we have automobiles with special racing motors, de luxe editions and special blends of smoking tobacco. Logically enough, wide-awake business cashes in on the desire inherent in most people to possess something different as soon as or sooner than they can afford it.

Few manufacturers are keener about supplying their customers with new products and different products than are the ice cream makers. Not so long ago there were three standard flavors of ice cream—strawberry, chocolate and vanilla. On special occasions raspberry, coffee and banana ice cream came to the fore. The immediate popularity of these "specials" started a race in creating new frozen novelties to meet the growing demand for desserts that were different.

In recent years the ice cream manufacturer has catered to this demand by featuring "specials" with euphonious names for holiday or week-end consumption. He has added new products which have increased his total gallonage and which, as a rule, have brought higher prices than the three standard flavors which for years have sold week in week out without much attention.

The Orange-Crush Company, Chicago, manufacturer of soft drinks, is one of the newest entries into the ice cream field on a national scale. This company will not attempt to manufacture ice cream, but will license certain manufacturers to make ice cream, ices and sherbets flavored with Orange-Crush, Lemon-Crush and Lime-Crush compounds, putting the prestige which its "Crush" beverages have established behind its new plans in a campaign of national advertising.

In its first national announcement the Orange-Crush Company told the ice cream manufacturer and the consumer the story of the opportunity to feature new "specials" as follows:

Here is a real piece of appetite news:

Delicious ice cream, ices and sherbets flavored with genuine Ward's Orange-Crush — also the companion flavors, Lemon-Crush and Lime-Crush — are now being made in nearly every principal city and town in the United States and Canada by one exclusively licensed ice cream manufacturer.

These are the same flavors, especially prepared for frozen products, which have made the drinks, Orange-Crush, Lemon-Crush and Lime-Crush, the largest selling citrus-flavored beverages in the world.

In some places special bricks of varying combinations will be featured. In other places, the "Crush" flavored ice cream, ices and sherbets will be obtainable in bulk. Watch for signs and local newspaper announcements in your community.

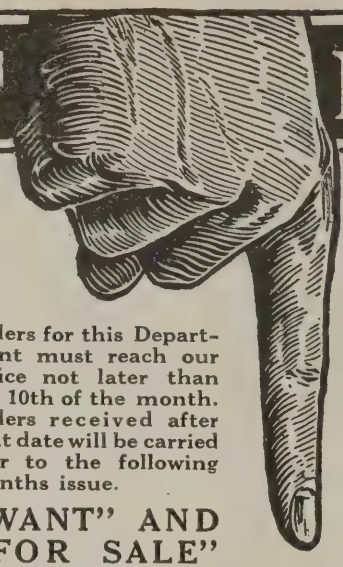
Although this is the first national announcement, frozen products made with these flavors have been sold in an ever-increasing number of places during the past three years. Perhaps you are already acquainted with them. If not, you have a treat in store for you.

The same first-quality ingredients used in preparing the "Crush" drinks are used in the "Crush" ice cream flavors. Fruit oils and juices from oranges, lemons or limes are delicately compounded by the exclusive Ward Process with U. S. certified food color and cane sugar. Purity is scrupulously guarded.

National advertising will continue steadily through the spring and summer months and into the fall. At the same time the company will advertise through its manufacturers and retailers with a vast amount of window posters, movie slides and the usual dealer helps. Each week for twenty-six weeks a unique brick or bulk special will be featured composed of frozen delicacies made with "Crush" flavors such as "Tropical Orange Crush Brick" and "Lime Crush Temptation."

Local advertising, carefully planned and scheduled to sell these specials, is made available to the local ice cream manufacturer. In other words the local ice cream manufacturer has a different novelty ice cream or sherbet to feature every week during the ice cream months and fresh advertising to help him put his selling message across. The reader of the advertising, while he learns of frozen dishes that he probably has never tasted before, is impressed from the prominence given the words "Orange Crush" with the fact that it is the established beverage company that stands behind them. The older products are, in this way, helping blaze the trail for the new venture by standing sponsor for them.

In Miss Lulu Bett, Grandma Bett is for plain "vanilly" without reservations because it "sits better." But Grandma Bett is not typical of the present-day ice cream consumer. She is a survival of the Rutherford B. Hayes period, when ice cream was an event and there were only three flavors. Today we, as a nation, eat somewhere around 300,000,000 gallons of ice cream a year—a per capita rate of a little more than a dish a week the year 'round.



Naturally the manufacturer would like to see each of us averaging three or four or more dishes a week. To this end he is advertising ice cream as a pure food and featuring specials with their appeal to the individual who wants something new and different. Ice creams, ices and sherbets made with the "Crush" flavors is the Orange-Crush Company's composite answer to the manufacturer's cry for greater gallonage, its own desire for more sales and the public's demand for something "special."

LIVE ONES.

The folks who are pushing "Babe Ruth" chocolate coated base ball sales are going at it like experienced business men. They believe in carefully planned publicity, and keeping at it. Co-operation doesn't stop with the dealer—they go further and join hands with other progressive folks who are pushing the ice cream industry to the fore. They are new members of the National Association of Ice Cream Manufacturers and the Association of Ice Cream Supply Men. They will exhibit at Cleveland. The Elite Chocolate Coated Base Ball Co., El Paso, Texas, are the people behind this popular product and they report a most favorable reception among the best ice cream manufacturers of the country because of the merit of their product and their advertising policy. At the Pageant of Progress in Chicago early this month their exhibit attracted very favorable attention and their premium plan of giving away real base balls, autographed by Babe Ruth, made a distinct hit.

WANT DEPARTMENT

Orders for this Department must reach our Office not later than the 10th of the month. Orders received after that date will be carried over to the following months issue.

"WANT" AND "FOR SALE"

Notices will be published at the rate of 2 cents per word, cash with order. For blind address 15 cents extra.

NOTE: Names and addresses of advertisers using blind addresses cannot be furnished direct from this office. The advertiser can be reached only by using the key number and addressing your reply care of "The Ice Cream Review."

NOTICE.

The Ice Cream Review disclaims any responsibility for the reliability of parties advertising in the Want and For Sale Department, nor for the truthfulness of statements made in such advertisements. In answering such ads, ask for references if parties are unknown personally, before sending money. Our subscribers are requested to assist us in keeping unreliable parties from advertising by reporting any suspicious dealings.

HELP WANTED

THE TREMENDOUS SUCCESS of the recently invented confection, "ESKIMO PIE," has demonstrated the wonderful possibilities of protective patents and trade-marks for novel confections. Patents procured, trade-marks registered; 22 years' experience. Instructions and terms on request. Robb, Robb & Hill. 920 McLachlen Bldg., Washington, D. C., and 1385 Hanna Bldg., Cleveland, Ohio. 2-22tf

If you want help for your factory, the quickest and cheapest way to locate same is through The Ice Cream Review Want Department.

EMPLOYERS!—Men, men, men—the crying need of the day! If you need any men in your business today, read the following ads and see if you can use any of these. The fact that these men are advertising here stamps them as unusually progressive. Write them and give them a chance to sell their services to you. "Ice Cream Review," Milwaukee, Wis. tf

WANTED — Experienced man to make fancy and decorated ice cream for private trade. Steady work the year around. Write P. O. Box 117, Milwaukee, Wis. 8-22

WANTED — A practical man to take financial interest in a very modern and up-to-date ice cream plant, doing a wonderful business, which business compells to expand. In one of the best cities in the United States, located in the middle west. Must have good practical experience and capable of managing the productive end of the business. These chances are few and far between. Give references. Address: R-308, Ice Cream Review. 8-22

WANTED—To manufacture by dairy specialty manufacturers of international reputation patented articles on royalty basis or will purchase good patent outright. Send complete information with blueprints. Address: R-309, Ice Cream Review. 8-22

POSITION WANTED

POSITION WANTED — By an experienced ice cream maker. 12 years experience. Understand viscolizer, homogenizer and York machine. Best of reference. Address: T. L. Pearson, Box 826, Laurel, Mississippi. 8-22

POSITION WANTED—University graduate in dairy manufactures with several years experience in plant and department management desires position as manager or assistant manager of production with large ice cream firm. Familiar with modern methods and equipment. Available after September. Address: R-303, Ice Cream Review. 9-22

POSITION WANTED — As manager of ice cream plant, possessing proven executive ability, thoroughly familiar with both manufacturing and distribution. Well educated, plenty of energy. Give full particulars in first letter. Address: R-311, Ice Cream Review. 8-22

POSITION WANTED — By ice cream maker, thoroughly experienced in all details of manufacture, refrigeration, etc. Married man, not afraid to work; capable taking full charge medium size plant. Address: R-312, Ice Cream Review. 8-22 8-22

POSITION WANTED—As Southern representative for ice cream supply firm by man thoroughly acquainted with conditions in the Southern ice cream industry; for a number of years close to Southern manufacturers. Address: R-307, Ice Cream Review. 8-22

FOR SALE BARGAINS

FOR SALE—Wholesale ice cream plant in city of 20,000 population, 4 railroads, large territory, located in heart of city, largest ice cream business in territory. Up-to-date plant. Also butter business locally and sub creamery within forty miles in dairy belt. Will sell both plants. Address: R-238, Ice Cream Review. 3-22tf

FOR SALE — Will sell my share in creamery and ice cream factory in one of the best towns in Minnesota, 5,000 population. Good shipping facilities. County seat. You will have privilege of buying the whole thing. Address: R-304, Ice Cream Review. 8-22

FOR SALE—Perfection, factory overhauled, forty-quart batch ice cream freezer with brine box and pump as good as new; never used after overhauled; this freezer has only froze about twelve thousand gallons ice cream and is the latest model, with new scrapers and everything in A No. 1 shape; regular price, $800; will sell for $500 cash. Lake Pepin Co-operative Creamery Association, Lake City, Minn. 8-22

FOR SALE — Confectionery and ice cream parlor, in one of the best cities in Michigan, population 6,000; only two soda fountains in the city, and doing a good business. Reason for selling, have two stores. Will sell on reasonable terms. For particulars write: B. Mazzolini, St. Johns, Mich. 8-22

FOR SALE—Ice cream plant of 70,000 gallons annual output in good Indiana city. Will sell either one-third interest to experienced ice cream man or the entire business. Plant is new and modern, storage rooms, compressor etc. Poor health of manager is reason for selling. Address: R-306, Ice Cream Review. 8-22

FOR SALE — Small modern ice cream plant in city of 5,000 people, on three railroads, in good territory. Plant is now in operation. Situated so that steam, hot water and rent are very cheap. Owners ice business requires all his attention. Searcy Ice Company, Searcy, Ark. 8-22

Exceptional Opportunity

To earn big commissions by selling a REAL fuel and oil saver, which at the same time INCREASES POWER. Nationally advertised, well and favorably known. If you are acquainted with engineers in plants wherever power and refrigeration are used, write us. Give references and what mechanical experience you have had.

Box 502 Wellston Sta. St. Louis, Mo.

FOR SALE—One 40-qt. ice cream freezer, belt driven, Cherry design, in good working order for $200.00 cash or terms. Phone Joliet 4520. Flint Sanitary Milk Co., 410 Collins St., Joliet, Ill. 9-22

FOR SALE—Second hand 40-qt. vertical combined ice crusher and ice cream freezer with direct motor drive; motor is 2 H. P. alternating A. C, single phase, 60 cycle, 220 volt, Century Electric. This outfit has been used very little and for practical purposes is as good as new. Price $150.00. Address: R-302, Ice Cream Review. 8-22

FOR SALE—One Type C Sealright ice cream filling machine No. 617. W. F. Campbell, 84 Main St., Nyack, N. Y. 8-22

FOR SALE—One hand power Sealright filling machine. $125.00 freight paid. Address: R-310, Ice Cream Review. 8-22

MACHINERY AND SUPPLIES AND BOILERS, NEW AND SECOND HAND—Electric Motors, Engines, Pumps, Pipes and fittings, Valves, Belting, Shafting, Bearings and Pulleys. Money Saving prices. Harris Machinery Co., Minneapolis, Minn. 12-20tf

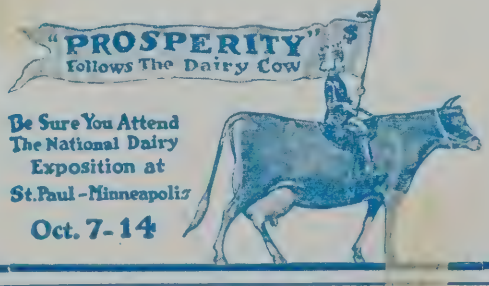
URBANA, ILL

An installation of Cherry Freezers and Batch Mixer in the plant of the Better Maid Ice Cream Co., Alameda, Calif.



We Do Not Tell

an automobile manufacturer how to produce cars, nor the ship-builder how to make motor boats, nor a baker how to bake bread.

Our business is to produce superior ice cream plant equipment designed to give you maximum results at a minimum cost.

In hundreds of plants scattered from coast to coast both in the United States and Canada you will find Cherry Freezers and Cherry Batch Mixers employed in the manufacture of the very finest grade of ice cream.

An interview with us long enough before your next equipment requirements to allow ample time to study your needs and offer suggestions, we believe would be worth your while. You will find, as we know the experience of others has proven, that an installation of Cherry Ice Cream Equipment in your plant will be one of the most profitable and satisfactory investments you have ever made.

The Sixteenth Annual National Dairy Exposition

ST. PAUL and MINNEAPOLIS

Oct. 7th to 14th, 1922

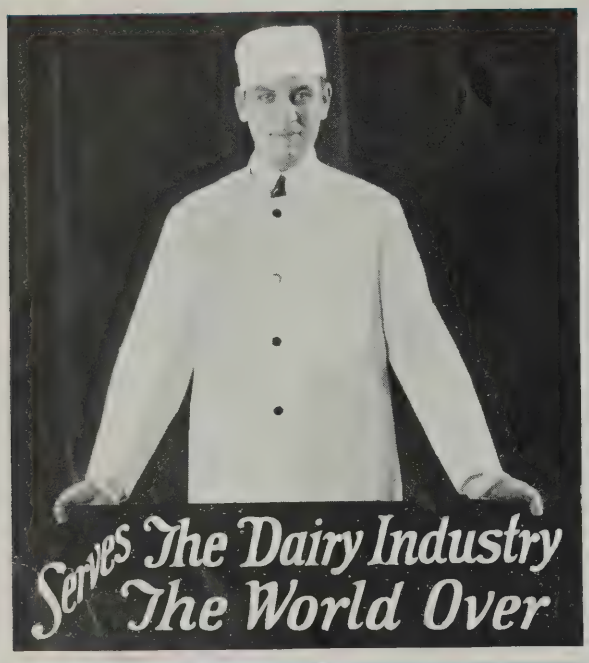
TWO MILES OF MACHINERY

THE output of hundreds of great manufacturing plants has been gathered in one grand ensemble for the inspection of the milk dealer, the butter maker, the ice cream maker, the cheese maker, the dairyman and other manufacturers and distributors of dairy products.

Here in the short space of one week —under one roof—you can inspect and compare the latest, up-to-the-minute types of every machine known to the dairy industry.

Here you will see the largest churn in the world, the biggest bottle washer, the most efficient ice machine, and every marvel of the dairy world.

Here you will see machines that will increase your output, improve your product, and reduce your expenses. You will have an opportunity of conferring with nationally known dairy engineers and with operators of great dairy plants. Any one of the many new ideas you will get from a visit to this great Exposition may be worth hundreds of dollars to you.



Concurrent with the Exposition will be great conventions of milk dealers, creamery men, and others who will discuss matters of interest to the dairy industry and who will be addressed by national leaders.

Prepare now to go with your associates. Bring your family and enjoy the open-handed hospitality of the Northwest Country—the Vacation land of America.

Reduced fares on all roads during the Exposition.

Prosperity Follows the Dairy Cow

Hitch Your Ice Cream

FOR every operation in your plant, there is available Davis-Watkins equipment endorsed by the leading ice cream and milk plants of this nation and foreign countries. It is distributed direct to you thru a growing network of branches. Wherever you are, there is within easy reach a Davis-Watkins' service engineer to serve you.

See Our Exhibit at the Shows

Take advantage of the reduced fares and attend either the National Dairy Exposition at St. Paul - Minneapolis, October 7 - 14, or the convention of Ice Cream Manufacturers, Cleveland, October 16, 17 and 18.

An exhibit of Davis-Watkins equipment will be on display at both shows. Be sure to drop in and pay us a visit.

Seamless Steel Ice Cream Cans

Bottoms furnished either Round Corner or Flat as shown in illustrations.

No crevices or sharp corners, inside or outside. No solder or lead used in construction as in pieced-up cans. ***Drawn from a single flat plate of flange quality steel*** and double coated with pure tin.

Drawn from No. 14 U. S. gauge steel the bottom stays full thickness to provide for hard usage while the sidewalls are drawn out to No. 16 U. S. gauge. Compare illustration. (B-C.) The drawing process hardens and toughens the steel making it almost impossible to dent the can.

Seamless steel cover flange is "shrunk" on to can and welded all around. No place for brine to lodge.

Handle lugs and bottom protection buttons are electrically welded to can.

Standard Sizes—10, 12, 20 Quart.

Covers fit all sizes. Cans and covers made with or without handles. Name pressed into can and cover if desired.

Nothing to come apart when retinning. No trouble from short measure due to improper re-assembling, which is probable with the pieced-up cans.

These cans are built for REAL SERVICE
Free you from trouble---AND THEY LAST

SEVERAL questions of vital interest to ice cream manufacturers are discussed in this issue of The Ice Cream Review, many of the contributions coming from ice cream manufacturers. In a recent issue we raised the question relative to building up a home demand for ice cream. We called attention to one ice cream manufacturer, who, after three years' effort, has failed to get the local retailers to handle his product in spite of the fact that he makes good ice cream. This is not a hypothetical case. We are quite familiar with the circumstances. The man is a hustler, makes good ice cream and has built up a splendid demand for his product in adjoining towns. The retailers, with one exception, have refused to give up handling cream from outside plants which they handled before he started making ice cream. He has worked with them for three years and they hang to the brands of ice cream they have always handled.

You will also find a number of communications in which the subject of freezing the mix is discussed. Some very valuable information is brought out in this discussion. Several pages are also devoted to the question of why the viscosity of the mix increases with ageing.

We hope that our readers are getting benefits from these discussions commensurate with the effort and expense we put forth to bring them to light. It is not the easy way to edit a trade publication but we believe that it is helping to build the industry.

IN JUST a few days now it will be time to pack your grip and make that trip to the National Dairy Exposition in the Twin Cities, and from there to Cleveland to attend the annual convention of the National Association of Ice Cream Manufacturers and to see the wonderful exhibit of machinery and supplies put on by the Association of Ice Cream Supply Men. We realize this is going to take you away from your business for a few days, but if you will do this you will have a better and bigger business a year from now than you will have if you just shut yourself up in your shell and stay at home.

Mossbacks always have hard shells. Moss can't grow where there is no shell. Don't let the shell grow and then there will be no temptation to stay in it. It is well to keep in mind the biggest and most prosperous ice cream manufacturers in the country are the ones who have the convention habit. They didn't wait until they were big either before getting the habit. Look up their records and you will find that they have been attending ice cream conventions ever since ice cream conventions were invented.

There is nothing extraordinary about this fact either. The men who go to conventions grow big and their business grows with them. Don't stay away from conventions and shows because your business is small; don't stay away because the big fellows seem to be the ones who are most active in the various trade associations. Their activities have helped them to grow big and they know that it pays them to be active. Be one of them.

JUST because your business is comparatively small is no reason why you should not avail yourself of the opportunity and co-operate with the National Dairy Council to boost for the industry and at the same time build your business bigger. Some folks think that in order to work with the National Dairy Council it is necessary to contribute money for which one gets no direct returns. This keeps many disinterested because they feel they can't afford to "donate."

It is unfortunate that such an impression prevails. True, contributions are made by many far-seeing men in

the business who believe in "indirect" returns as well as direct returns, but the National Dairy Council is in position to help the non-contributor build up the demand for his products. The men back of it realize that as they increase your business they are boosting the dairy business just that much. The Council has dairy advertising material, in variety and abundance, which is available to you at a definite price which you can buy and pay for just as you would purchase any other commodity. There is something in stock that will apply to your business. You can help the ice cream industry by doing more business in your plant. If you haven't tried it, do it.

⚜

ALL progressive ice cream manufacturers believe in advertising. They know that good advertising, backed up by quality ice cream, has not only developed their business but it has had not a little to do with the wonderful development of the ice cream industry. Some manufacturers are good buyers of advertising, they know the kind of advertising that will get results.

Buying advertising is almost an art. Some men make the mistake of buying advertising that appeals to their peculiar notions of advertising rather than being guided by the experience of others. If they can see their ideas in print they are happy and they think they are advertising. If they call upon an advertising man to get up some literature for them they tell the advertising man just what they want and how they want it.

A man thus inclined, in order to be consistent, should tell his family doctor just what to prescribe when he calls him on a case. True, many men nowadays know exactly what they want in a doctor's prescription, but they are usually in pretty good health when they call the doctor. In case they are calling him for a legitimate purpose they put their case in his hands and abide by his judgment.

When you buy advertising from an advertising man, in whom you have confidence, you can get your money's worth only by getting the benefit of his advertising experience. He knows what attracts favorable attention, he makes it his business to study advertising. He knows what constitutes "human appeal" and he knows how to combine the 26 letters in the alphabet in the most effective way. Of course, if you are a better judge of advertising than he is you can profit best by requiring him to carry out your ideas. In such case you do not need his services. The ice cream business needs more advertising and while we are about it let's give it more effective advertising.

⚜

THE months ahead are convention months, not only for men interested in various lines of dairying, but for men in most lines of business. They get together to exchange ideas and make acquaintances. They discuss new developments in the industry in which they are interested and agree upon business policies. While a large number of subjects come up for discussion at these various trade conventions, the two big problems which are always uppermost are QUALITY and SERVICE.

If you doubt this, just sit down and make a list of the many problems incident to your business and then see how many items on your list may be properly classified as QUALITY OR SERVICE problems. Give the right kind of quality and the right kind of service to your customers, both in buying and selling, and your business will "blossom like the rose." Possibly you will find that all your business problems may be properly classified under these two heads. We believe you will.

⚜

MANY ice cream manufacturers will soon reach the close of "the season" in their business. They will call in their cabinets and packers and do everything possible to cut down on expenses. They will stop all advertising and lose just as little money as possible between the close of this season and the opening of next year's season.

Other manufacturers will fight harder than ever to push the sales of ice cream. They don't have a closed season in their business. True, they may not sell as much ice cream when cold weather comes, but they keep right on making and selling ice cream. They believe that ice cream is a food, not a fad; they believe that it is good for folks to eat in the winter months; they believe this so thoroughly that they tell other folks about it and instead of shutting up shop and waiting for another "season" to open they keep right on doing business. Anyone can sell good ice cream in hot weather, but it takes a real business man to sell ice cream in cold weather.

⚜

AT THE Wisconsin State Fair, which was held here recently, the ice cream men of the state joined hands with other dairy products manufacturers and put on an exhibit in the dairy building which was a credit to everybody connected in any way with it. A corner of the exhibit in one of the big display refrigerators was set apart for the ice cream exhibit and attracted much favorable comment. Different ice cream dishes were shown in papiermache and a mechanical life-sized boy eating an ice cream cone was easily the center of attraction. Placards and advertisements emphasizing the deliciousness and food value of ice cream helped to carry the message to State Fair visitors. There are lots of ways of advertising ice cream and oftentimes it can be done most effectively through the co-operation of a number of manufacturers.

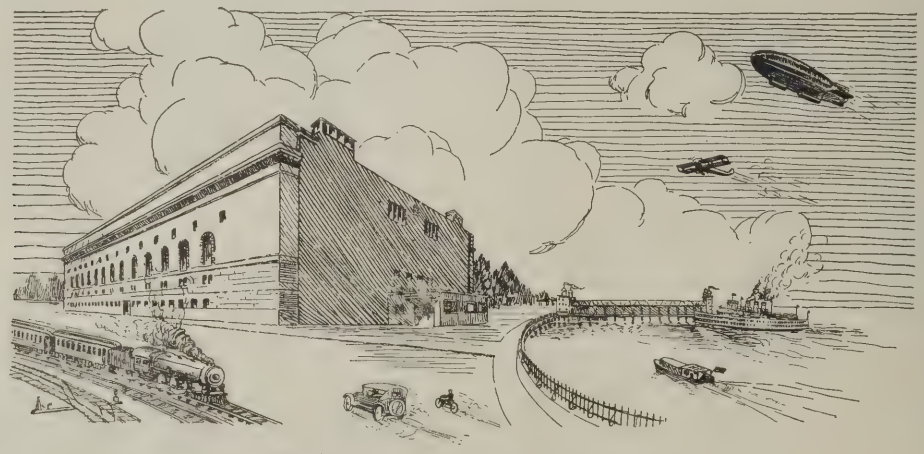
⚜

AN ICE CREAM expert made the statement at a recent convention that practically all bacteria in ice cream comes from milk, cream and the butter used in the mix; that is providing the other ingredients are high grade. Buy the very best gelatine and other ingredients and you need not worry about poor quality so far as those ingredients are concerned. He says that experiments have proven that using good gelatine does not materially increase the bacteria count. Good gelatine is practically free from bacteria in spite of the fact that it is such a good medium for bacteria growth. This is just another evidence that in order to make a good quality of ice cream the best materials must be used.

The Cleveland Convention and the National Exhibition

All roads will lead to Cleveland, Ohio, next month when the National Association of Ice Cream Manufacturers meet in their annual convention and the Association of Ice Cream Supply Men hold their national exhibition.

Cleveland is on the principal travel highway from New York to Chicago, within a night's ride of the Atlantic ocean and the Mississippi river. Steamboat lines connect Cleveland with every port on the Great Lakes. Many delegates can avail themselves of the privilege of using combination rail and steamship tickets, thus making the trip most enjoyable.



Cleveland has 90 hotels. There are more than 5,000 rooms in modern fire-proof hotels and convention delegates can secure a combination to suit all purses. The hotels are centrally located and no delegate need feel that he must put up with inconveniences. Reservations have been heavy at the leading hotels but the Cleveland Committee promises that everybody will be nicely taken care of.

We hope that readers of The Ice Cream Review will go to Cleveland in large numbers. Many of our readers have the convention habit, but there are many who let business keep them at home when they could, by planning ahead of time, attend the convention with profit.

In these days of business uncertainty and rapidly changing conditions, it is most important for all business men to keep abreast of the times, to learn how their business might be effected and to prepare to meet the situation successfully. The many problems confronting the business world today cannot be solved by the individual, they can only be solved by collective thought and action; constructive co-operative ideas must be brought out and business conventions do this very thing.

There never was a time when business organizations and business conventions were more essential to the healthy growth of business. Acquaintances are made at the conventions and ideas exchanged and friendships established that are profitable to all. The man who thinks it does not pay to attend his trade conventions simply doesn't know the real value to be gained from such conventions. The men who go are the men who know and they keep on going year after year.

Delegates to the annual convention this year will enjoy the privilege of visiting what will probably be the greatest display of ice cream machinery and supplies ever staged. The opportunity to learn facts first hand about the latest and best in the equipment and supply line will repay any ice cream manufacturer for the expense incurred attending the convention.

Municipal Auditorium, Cleveland.

Largest Exhibition Before 1922 Outdone.

Nearly 1,500 men and women associated in some way with the great ice cream industry of the continent are still recalling to mind the great Buffalo Exposition of The Association of Ice Cream Supply Men held the last day of October and the first five days of November, 1921.

Visitors came to inspect this display from twenty different state and four Canadian provinces. The Show was not only the greatest in size ever held until then, but was eminently a success in all its other features.

The various trade publications of the ice cream industry characterized the Show, for instance:

"No event of greater interest to the ice cream industry of the country has even been known."

Largest Until Then.

"The largest exhibition of ice cream making essentials ever known, which came to a successful close November 5th in Buffalo."

"One of the most successful exhibitions ever given."

"It was successful in many ways and in respects not expected."

"The Buffalo Exposition was the best in all particulars ever held by the Association."

In fact, it was generally admitted that the Buffalo Exposition gave the industry its own truest idea of its real size and possibilities that it had ever had. This was admitted by both ice cream manufacturers and supply men who have been developing equipment and furnishing supplies to the industry for a decade or more.

Cleveland Bigger.

The Buffalo Exposition, however, large and successful as it was, was only a regional exhibition of The Association of Ice Cream Supply Men, promoted primarily as a service to the ice cream plants of the eastern section of the country.

The great national exposition at Cleveland, on the other hand, is what its name implies, a great educational and sales display promoted for the benefit of ice cream manufacturers from coast to coast, at once a great exchange for ideas, plans and methods, and a great industrial fair, through which no ice cream manufacturer can possibly walk without profit to himself.

A number of altogether new pieces and types of equipment and apparatus were displayed at Buffalo, intensely interesting every ice cream manufacturer there. It is expected that the Cleveland Exposition will be a place of introduction to the industry again this year

(Concluded on page 128)

NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS
INCORPORATED

CHARLES G. MORRIS, President
New Haven Dairy Co. New Haven, Conn.

N. LOEWENSTEIN, Secretary
155 North Clark Street Chicago, Illinois

The Twenty-Second Annual Convention of The National Association of Ice Cream Manufacturers

Will Be Held at Cleveland, Ohio, Hotel Hollenden, October 16, 17, 18, 1922

Chicago, August 16, 1922.

Work on the program is progressing in a very satisfactory manner. At this writing the subjects to be discussed stand about as follows:

"How May We Stabilize Business for 1923?"
"Problems of Distribution."
"What are the Best Methods of Advertising Ice Cream?"
"Problems of Suburban Delivery."
"Investigations in the Manufacture of Ice Cream, by U. S. Department of Agriculture."
"Patents, Copyrights, Trade Marks and Licenses."
"Ice Cream Shipments via Express."
"Present Day Problems in the Industry."
"Still Air Hardening, Blast Hardening, or Air Circulation Hardening?"
"The Manufacture of Brick Ice Cream."
"Cost Accounting."
"Brief Resume of the High Lights of the Convention."

We hope to be able to send a copy of the completed program to you with our next letter, and right now we want to impress on every Ice Cream manufacturer that we are going to expect him to come prepared to say and do something that will contribute to the success of the meeting. Ample discussion will be had of all the subjects on the program.

Application has been made for reduced railroad fares.

If your hotel reservations have not yet been made, please make use of the enclosed blank at once. We want all Ice Cream manufacturers to be taken care of in a satisfactory manner, and if you send in your reservation now it will be handled in a manner to meet with your entire approval. Please act promptly.

We feel we can honestly say that the three days of our Convention will be the most profitable you will ever be able to spend at any meeting. Come with your mind made up to enter into the discussions—get acquainted with your fellow manufacturer. He may have solved the very problems that are bothering you, and he will be glad to tell you all about it.

The social activities will also be very enjoyable. You are promised an all round good time.

"Every man owes a part of his time to the upbuilding of the industry to which he belongs."—Theodore Roosevelt.

No one can fail to appreciate the wisdom of this statement, but apply it, in this particular instance, and make up your mind to support the Convention with your presence.

* * *

"The Substance of His House."

A writer has given the above title to one of his recent works and it seems quite apropos for this bulletin, the real subject of which is

"Co-operation."

Co-operation is ancient. It came next after competition, the essential condition of savagery, and it is the one thing which more than anything else has lifted the human race above the brute. It started as a simple measure of defense. It has grown to a most complicated matter of community action for aggressive measures of betterment. The widest possible co-operation is essential to civilized man today, for there are vast problems confronting the world in general and our industry in particular which must be solved.

Since the early ages, long before history begins, men have co-operated for common protection and have thus found strength instead of weakness, peace instead of war. They soon learned that co-operation meant organization and organization meant strength and security. The individually weak sought the strength of organized numbers, and the individually strong, seeing possible disaster to themselves in disaster to the weak, sought self-preservation through the protection of all.

Common need may drive them together, but the basis on which men must actually co-operate is the ground of common understanding and the world must look to co-operation to rehabilitate it. In industry as well as in affairs national and international the hope of progress lies in co-operation.

In the field of human relations as regards commerce and industry men have advanced a long way from where they were when first the need of co-operation was experienced, but they still have far to go. It is only in a limited way that they dare trust each other as yet. Most men will stand considerably more confidence and trust than they get.

Co-operation is undoubtedly the road to industrial harmony, but to obtain this all unfair business practices must be eliminated. Substituted therefore must be a system devised as the result of intelligent co-operative effort, under which men will play the game as they do golf or baseball or tennis—to win, but to win under the rules, as a gentleman. Such a system, far from interfering with production, will stimulate it and build up sound co-operative competitive relationships. Conditions likely to cause disputes will be anticipated before they have an opportunity to develop into problems dangerous to the stabilization of the industry as a whole.

Therefore, we may well say that co-operation is the **substance of our house.** The annual meeting of a trade association helps us to conserve our substance and reach a ground of common understanding with our fellow men, thus automatically solving our common problems and presenting a united front to our common enemies, whether they be individuals or conditions.

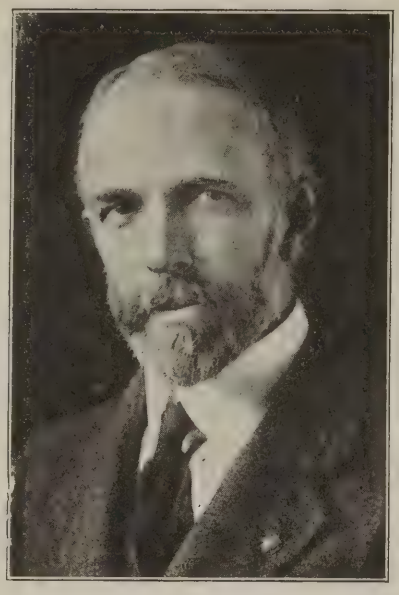
If ever there was a time when co-operation was needed in our industry it is the present. Meet your competitor with a smile, play the game with both feet on the ground, and if your competitor is not a member of this Association, induce him to join, as a first evidence of your intention to co-operate with him. Also invite him to come to our forthcoming Convention, where he will be cordially welcomed. And don't forget to come to the Convention yourself.

NOTICE!

On January first, 1922, the John Schroeder Lumber Co., Milwaukee, Wis. took over the plant of the Wisconsin Woodworking Co. at Two Rivers, Wis., and since that time has been actively engaged in the manufacture of ice cream tubs, candy pails, butter tubs, pickle kits, and other woodenware products. The production of the plant has been over-sold to date as the company has found a ready market awaiting these new Schroeder-Perfection Products.

OKLAHOMA DATES SET.

The 1922 convention of the Oklahoma Association of Ice Cream Manufacturers will be held in Oklahoma City December 18, 19 and 20, at the Lee Huckins Hotel. Mr. S. P. Lay, Tulsa, Oklahoma, is secretary-treasurer.



WEST VIRGINIA CONVENTION.

The 1922 convention of The Ice Cream Manufacturers Association of West Virginia will be held in Huntington on Nov. 20 and 21st. Mr. C. F. Jamison, Huntington, West Virginia, is secretary-treasurer.

The National Dairy Exposition

Our folks who are planning to attend the National Dairy Exposition on the Minnesota State Fair Grounds, midway between St. Paul and Minneapolis, will be interested in the following description of St. Paul and its opportunities for pleasant side trips. The St. Paul Association of Commerce contributed the following:

St. Paul considers itself fortunate in having secured permission to act as host to the 1922 National Dairy Exposition. When you arrive in St. Paul to attend the National Dairy Exposition we also want you to see all that you can of St. Paul and we feel confident that you will more than enjoy all that you see. And in order that you may better understand and appreciate our city, we wish to outline briefly some of the reasons which make St. Paul the leading city of the Northwest, as well as point out some of the principal points of interest which we hope you may visit.

In the Heart of the Downtown Section, St. Paul.

St. Paul was incorporated in 1854 and the orignal site of the city was on the banks of the Mississippi River, not far from the present location of the magnificent Union Station which is now practically completed. At that time river traffic was one of the large factors in the city's development. And from that time, until the present, St. Paul has been actual head of navigation of the Mississippi River. Although for years comparatively little use has been made of the river commercially, there is every indication that such traffic may be renewed in the near future.

With the development of the railroad industry in this territory, St. Paul became and has continued to be the railroad center of the Northwest. Today there are nine large railroad systems operating twenty-three lines running out of St. Paul. A number of these lines have headquarters here in St. Paul and in the operation of the trains, shops, etc, employment is provided for thousands of people. On Jackson street between Fourth and Fifth streets, you may see the largest exclusive railway office building in the world.

Jobbing has been one of St. Paul's largest industries since the city's earliest days. In the vicinity of the Union Station, about Smith Park, and extending as far as Tenth street, may be seen one of the great jobbing districts of the country. From these houses, goods of all kinds are supplied to the Northwest and in some cases to the entire country. The states particularly served by St. Paul jobbers are Minnesota, Northern Michigan, Wisconsin, Iowa, North Dakota, South Dakota and Montana. When one realizes that it is farther from St. Paul to the western boundary of Montana than it is from St. Paul to Florida, some idea of the extent of the territory served by St. Paul may be gained. Many of the larger jobbers have their own factories and manufacture a large proportion of the products that they handle. It is the ideal of St. Paul jobbers to give service and through unexcelled products, organizations which have been slowly and carefully built up, and with the best of railroad facilities, St. Paul jobbers do serve.

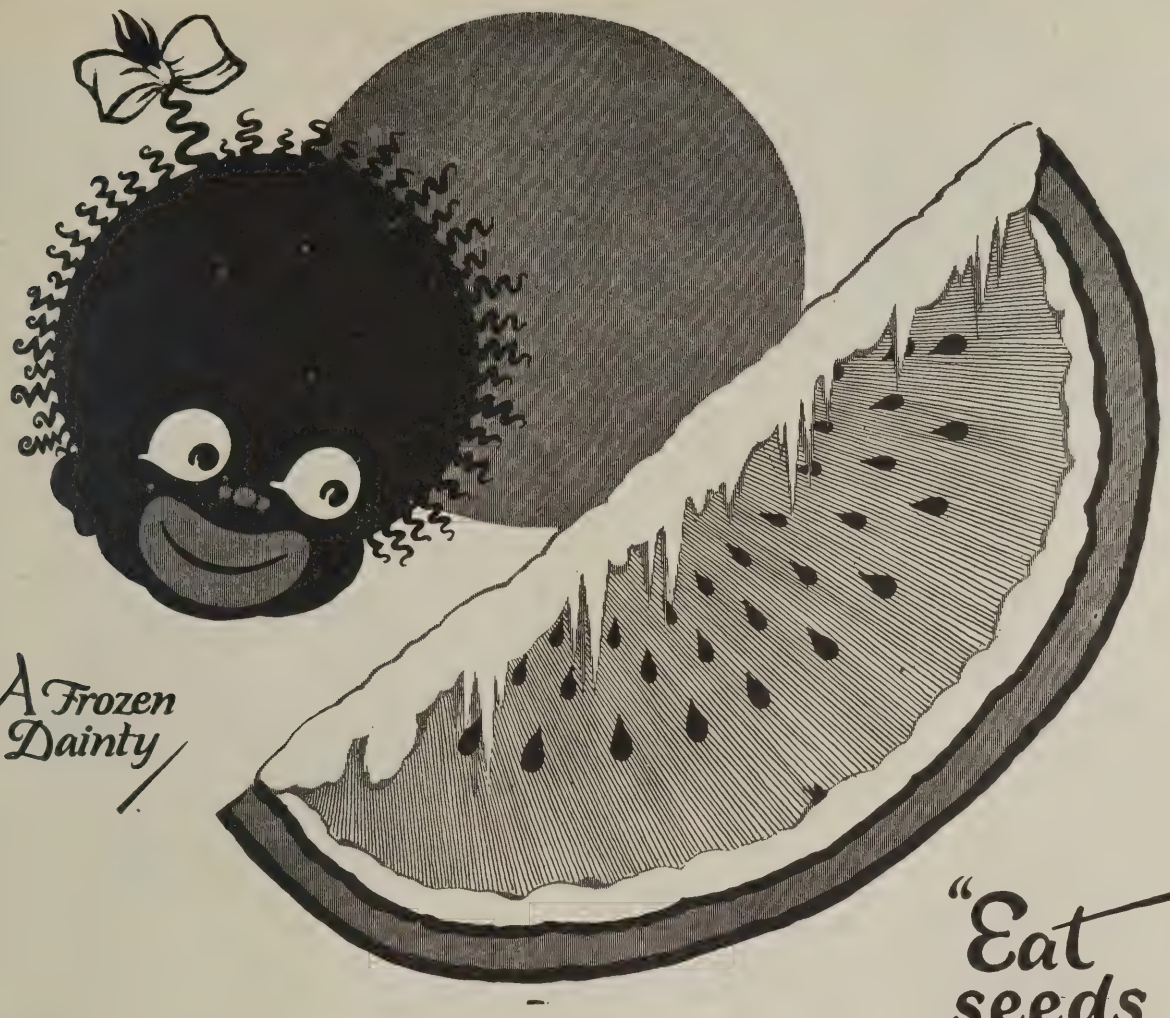
As a manufacturing city, St. Paul ranks well toward the fore. However, the numerous manufacturing concerns are not centered in any particularly locality but are found in many sections of the city. Meat packing is the largest single industry of this kind. South St. Paul is not only the largest meat packing center in the Northwest, but it is also the fastest growing livestock

ADEQUATE REFRIGERATING MACHINERY PREPARES FOR THE SEASON'S RUSH.

market in the world, while the new Armour plant, located at South St. Paul is the finest and most modern plant of its kind in the world. Swift & Company have also for many years operated a large plant which compares favorably with the new Armour plant. The various companies provide guides for guests who desire to inspect the plants, and a trip through one of the packing plants is well worth while. There are many large manufacturing plants in the city and St. Paul leads the Northwest in the production of fur goods, coke, hoisting machinery, cigars, rubber goods, food products, advertising novelties, refrigerators, gloves, hats, law books and shoes. One of the most rapidly growing manufacturing centers will be seen in going out University avenue. This district, known as St. Paul's Midway Industrial District, contains some of the finest industrial plants in the country.

It follows quite naturally that with its importance as a railroad, jobbing and manufacturing center, St. Paul should also be a leading retail center. There are probably very few cities regardless of size where better or more complete retail stores can be found than are found in St. Paul. On Sixth street, Seventh street, Robert street and Wabasha street, are located many of the larger retail and department stores, while most of the downtown section is occupied with retail stores of all kinds.

Although the business upon which St. Paul depends for its prosperity is largely centered in the downtown district, yet there are other portions of the city which should be seen in order to obtain a proper conception of the city as a whole. St. Paul covers in all fifty-five square miles of territory. Throughout the city are many parks, drives, and special points of interest which are more than worth the small effort required to visit them.



Starting almost from the downtown district and in fact from St. Paul's Cathedral, which, by the way, is one of the finest cathedrals on the continent, is Summit avenue. Summit avenue is the longest fine residence street in America and for almost four miles from the Cathedral on the east to the Mississippi River on the west, is one continuous line of fine St. Paul homes. Running both north and south from Summit avenue along the edge of the bluffs overlooking the Mississippi river is the River Boulevard Drive. Few equally beautiful drives can be found anywhere. At the southern end of the River Boulevard is historic Fort Snelling, which is now headquarters for the 3rd Regiment of the 7th Army Corps Area.

In the northwest corner of the city is Como park. With Lake Como, the fountains, gardens, conservatory and wild animal range, Como park offers much of actual interest in addition to its beauty. Farther to the north and east is Phalen park located upon the shores of Lake Phalen. Whatever lack of wild animals or conservatories there may be at Phalen is more than made up by a fine large bathing beach and an excellent eighteen hole golf course. Just a short distance southeast of St. Paul's downtown district, lies Indian Mounds Park. Here at a high elevation overlooking both the city and the Mississippi Valley to the south, are numerous large Indian mounds constructed years ago when the red men were still rulers of this region. Just below the brow of the hill at Indian Mounds park are located the Minnesota State Fish Hatcheries, from which millions of small game fish are distributed to all sections of the state. There are numerous other parks and drives throughout the city which limited space forbids mentioning. During the summer months many of the parks have regular evening band concerts, as well as other special attractions and entertainment.

There is an unusual opportunity for all kinds of entertainment in St. Paul. The theaters offer programs to suit every taste, whether it be the legitimate, vaudeville, or motion pictures. A particular effort should be made to see the Capitol theater. In appointments, decorations and programs presented, this motion picture house is unexcelled anywhere in the country. Some of the hotels and the various restaurants and cafes throughout the city provide dancing, special entertainment and similar forms of amusement during Exposition week.

Phalen Park, St. Paul.

A Frozen Dainty

"Eat seeds 'n all"

The New Sensation

Here's a winner for school days. The "kiddies" go wild over this new luscious, ripe pink slice of ice cream, half-moon shaped like a slice of watermelon and dotted all through with irresistible milk chocolate seeds — and they "eat seeds 'n all."

Over two hundred of the leading ice cream manufacturers in the United States and Canada have already been licensed to manufacture Picaninny Freeze.

One manufacturer writes: "We have been marketing Picaninny Freeze for ten days, averaging three thousand dozen a day. We have already received our first big value from this new product."

Another manufacturer writes: "We like to make Picaninny Freeze, it handles so easily and quickly and is so clean. We also like the long profit in Picaninny Freeze. It is a winner."

5¢

Representative ice cream manufacturers in territory not already closed are invited to request complete information, which will be forwarded immediately on receipt of letter or wire addressed to

"Picaninny Freeze--Eat Seeds 'n All"

OUT West, in Salt Lake City, lives a well-known cartoonist who has spent years in turning out ideas on the spur of the moment, any time the bosses wanted them. He worked for several years on the New York-American Journal under the famous Hearst editor, Arthur Brisbane. During another period he served as utility man for Judge; his drawings have graced the pages of that magazine from front to back cover. The late Elbert Hubbard knew his worth and made a personal friend of him, inviting him to the home of the Roycrofters in East Auburn, New York, to illustrate a series of magazine articles. Besides all these achievements, John S. Sears, the cartoonist under discussion, was associated for a number of years with the Borgfeldt Company of New York, manufacturers of the Kewpie Doll, and originated on his own hook, the nationally famous Skookum character.

But Jack Sears is never content with past achievements. His association with Brisbane, Hubbard, Borgfeldt's and others, and his training and experience as a cartoonist, have given him an ear that is tuned to the public pulse. A few months ago his "sixth sense" prompted him that the public was ripe for a five-cent ice cream package that could be marketed under a new fresh name. He set to work and conceived the idea behind the popular new frozen dainty, "Picaninny Freeze," which is rapidly sweeping the country in its wave of popularity.

This was less than four months ago. Today "Picaninny Freeze" sales run into the millions a day and this frozen confection is manufactured under license in more than 100 towns and cities from the Atlantic to the Pacific, from Canada to the Gulf of Mexico, and also in the Hawaiin Islands, by as many leading ice cream manufacturers.

The detailed story of this success is one of a good product and a distinctive advertising campaign.

While his idea was still in the rough, Mr. Sears took it to an advertising agency. A number of men who were experienced in the manufacture of ice cream were then called into consultation and this combination worked out the program which has put Picaninny Freeze where it is today.

Picaninny Freeze is a delicious bar of ice cream, representing a slice of watermelon, dressed up in holiday clothes. Strawberry ice cream, ripe-pink in color, half-moon shaped like a slice of melon, and dotted all through with irresistible, mellow milk chocolate seeds, is the winning combination used in this five-cent wonder seller. The slogan of the campaign is—"Eat seeds 'n all." Everything connected with the manufacture and sale of Picaninny Freeze has been patented, trade-marked and copyrighted.

These ice cream bars are individually wrapped in attractive, three-color wax-paper wrappers. They are sold from corner grocery stores, at amusement stands and parlors, drug stores, at amusement resorts, and from unique watermelon-shaped carts and strap carriers at depots, ball games, or wherever people congregate.

The first try-out for Picaninny Freeze was made in Salt Lake City. A teaser campaign consisting of three small ads featuring the slogan "Eat Seeds 'n All," commenced three days before the day of introduction. On the fourth day the Picaninny Freeze Company of America broke with a 60-inch ad over the name of the local manufacturer. On the same day a showing of posters, window streamers in the windows of dealers carrying Picaninny Freeze, counter cards and other dealer helps, went up simultaneously. From the outset the sale of Picaninny Freeze was tremendous, even greater, in fact, than either the licensors or the licensees had most optimistically expected. Before the end of the first week, the entire output of the manufacturer's plant had been more than doubled. This was late in April of this year.

With this start to encourage the patentors of Picaninny Freeze, a small handful of salesmen was sent out to win manufacturers. Naturally the first half-dozen or so contracts were hard to secure. Among the many obstacles which stood in the way of the immediate success of this new frozen dainty were the flooding of the market with hundreds of new brands of frozen dainties and also the fact that Picaninny Freeze was introduced at the peak of the ice cream season, when manufacturing plants in every section of the country were already groaning under the task of meeting the normal summer demand. In a great many instances, manufacturers felt that they had no facilities for producing a new product.

But these obstacles had no terror for the Picaninny Freeze salesmen. In less than one hundred days more than 125 ice cream makers, representing in nearly every instance, the leading manufacturer in every city, had become enthusiastic licensed makers of Picaninny Freeze. In the majority of cities where introduced, the Picaninny Freeze Company give the licensee exclusive rights for a period of years.

The royalties for the manufacturing rights are based on large production and consequently are very small. Of these royalties, not less than 40 per cent goes for continuous advertising to be placed in the territory of the manufacturer, over his name. Another ten per cent is reserved for legal protection for the manufacturer and the parent company.

The advertising campaign has been of a very distinctive nature. In most cases only one newspaper in a town has been used. Where the appropriation has permitted, poster advertising has also been used, and in every instance the dealers have been well supplied with attractive three-color window streamers, as well as with

(Concluded on page 151)

OUR NEW SOUTHERN CORRESPONDENT.

Mr. Craddock Goins, Atlanta, Georgia To Furnish Readers of The Ice Cream Review Regularly With News of the Southern Ice Cream Industry.

We have a real treat to set before readers of The Ice Cream Review. Said treat will be of special interest to our Southern readers, but of real interest to all. Mr. Craddock Goins, of Atlanta, Georgia, a newspaper man of wide experience and well known among southern ice cream manufacturers will act as our Southern correspondent and will keep Ice Cream Review readers posted on developments in that rapidly growing important ice cream section of our country.

MR. CRADDOCK GOINS.

When this business arrangement was concluded we naturally wanted to tell our readers something about Mr. Goins. We asked him to tell us something that we might use as a basis for a story. He wrote "ye editor" a personal letter which contains so much sparkling evidence of Mr. Goins' peculiar ability as a newspaper man that we are going to let you read extracts from it. This privilege will afford the reader a better idea of what to expect from his pen than anything we might write. Contributions from Mr. Goins relative to ice cream matters in the "Sunny South" will be found elsewhere in this issue. Here are the extracts:

"As a partner in industry, Mr. Irving S. Cobb, would say, I was "practically born and raised" in the South; but it would be difficult to qualify me as a Southerner in the sense that people north of the Smith & Wesson line generally accept the application, as no one in my long and otherwise honorable line of ancestry ever owned a slave or took part in a lynching.

I never had a real, bona fide negro mammy, as the old negress who gave me my early education in the escapades of Br'er Rabbit and the Tar Baby had a husband regularly employed by my father and regularly paid in American dollars, which further operates against my standing in that highly colored classification around which is centered so much romance and fancy, especially the latter.

In spite of this handicap, I succeeded fairly well in my early pursuit of life, liberty and happiness until I went to a southern college to learn that the term "dam yankee" were two separate and distinct words. Later I did enough newspaper work in the north to understand that all of the fighters do not live in Georgia, Florida, Alabama, etc., and the further fact that a gentleman in Hoboken or Kankakee is strangely similar to a gentleman in Mississippi; and that hospitality is something not confined by sectional boundary.

I developed an early love for the ice cream manufacturing industry, and it is a firm conviction of mine that the people below the Ohio river are destined to create a real ice cream-consuming nation.

The people of the south are of the best type of the Caucasian strain. I don't believe there is a better stock of pure-bred Americans anywhere, and I say this with all due homage to the character and thrift of that hardy race that explored our great West and to the astute New Englanders who were careful to make a great deal of money out of the slave traffic before discovering the evils of human subjugation.

Government statistics show that the South leads the nation in percentage of men physically fit, and basing my opinion upon the general understanding that a sound body and a sound mind go together, I believe that the South's business men are prepared to overcome the obstacle of scattered populations and seize upon their natural resources, which are the greatest in the world, with the same energy and intelligence that other sections have so remarkably improved lesser opportunities.

The ice cream people of the South are beginning to take their business more seriously. I remember when a certain prominent ice cream manufacturer used to be spoken of in his community, in a Southern city, in a facetious way, such as "that ice cream feller." Today that gentleman is recognized by his neighbors as one of the most prominent citizens of his city.

The ice cream business of the South is building because the ice cream manufacturers, themselves, are applying to their efforts the same kind of policies and business ethics as that of other legitimate business enterprises.

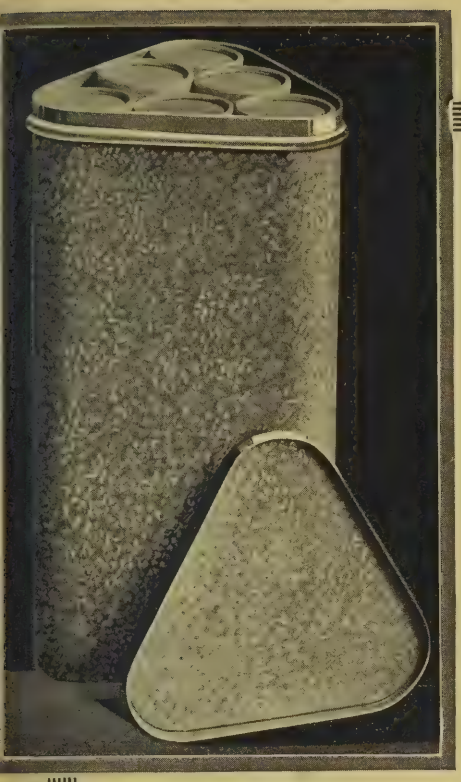
It is my firm belief that the time is not far distant when the Southern ice cream manufacturers, with their remarkable natural advantages, will be producing ice cream at a rate more than double their present output. The people of the South are beginning to appreciate the food values of milk products. They are beginning to appreciate the ice cream manufacturing industry and its contribution to human satisfaction.

My identification with the ice cream industry began three years ago, and the story leading up to my ice cream connections is something that I don't like to dwell upon.

It was after failing at seven successive attempts to make a living in the usual business lines after leaving college that I accepted the suggestion of a college president and proceeded to drive to drink most of the city editors from Atlanta to Chicago, in successive turns.

I did not take my newspaper work seriously until one day a city editor in Charleston, S. C., in a moment of forgetfulness, strode to my desk and said, "That was a darn good feature story you just turned in."

With this first word of praise that I had ever heard concerning my ability at any thing, there was, then and there, impressed upon me the dismal fact that I was doomed to follow the trail of printer's ink, a trail that has enriched me only in a store of experience and a multitude of musings upon things that might have been.



Not even the highly colored imagination that comprises my sole qualification in industry can enable me to find one solitary achievement in my thirty years to mention now. Probably the only act that gives me any claim to success in life was that when last June a year ago I married the nicest little Georgia peach in the Cracker State."

⚜

Approximately 750,000 men in this country are engaged in making, selling or repairing automobiles.

The first road building policy ever conceived in the United States was inaugurated in Kentucky in 1821.

No fewer than 20,000 motor busses are operated in the congested and undeveloped areas of the principal cities in this country.

Triangular Packer

for filled Sealright Containers

A PRACTICAL, simple, durable, efficient device to facilitate shipping, delivery and handling of Sealright Paper Containers filled with bulk ice cream. Keeps cream in containers in perfect condition. Requires minimum amount of space in tubs and cabinets—has greater holding capacity with increased icing space over that of the square brick cave. It's a decided improvement at about the same cost—an indispensable factor in the distribution of bulk ice cream in cylindrical paper containers. It's the connecting link that perfects the method.

for Standard Tubs and Cabinets

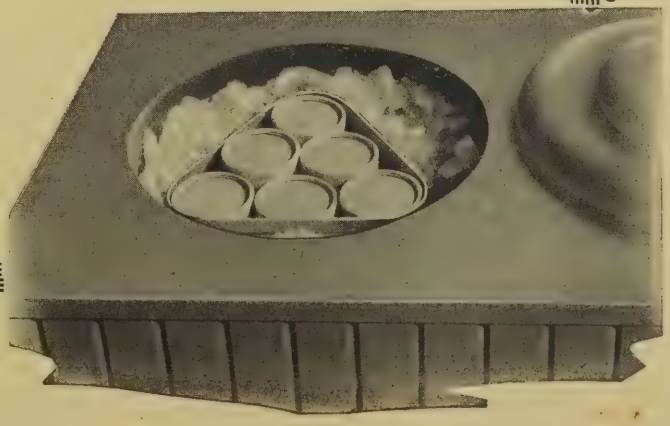
Serves Two-fold Purpose

In the Cabinet At Retailer The Triangular Packer is far superior to the square brick cave for holding cylindrical containers. It increases holding capacity, icing space and makes for a more easy selection of any size or flavor. No ice cream can is required. Packer remains in the cabinet. When empty, merely refill. Will seldom require washing as no cream can come in contact with Packer. No complicated lifting devices—no parts to get out of order or become lost. Its simplicity makes for greater efficiency.

In the Shipping Tub As a holder for filled containers in the shipping tub, the Packer is ideal. Note how ice entirely surrounds Packer in the tub. Ice cream remains in perfect condition in the containers until destination is reached. Where retailer does not have cabinet, Packer remains in tub. For country shipments and local deliveries this Packer makes a fine shipping proposition for the delivery of filled cylindrical containers.

Order Through Your Jobber—Or Write Us

OAKES & BURGER CO.



Established 1873

CATTARAUGUS - - - - - - NEW YORK

Maximum Refrigeration

Note ample icing space around Packer when in tub or cabinet. Note, further, how all containers in the packer come in direct contact with the sides of the packer. All containers receive maximum refrigeration from this direct surface contact. Further, note air spaces between containers in packer. This means still greater refrigeration efficiency. Containers continually and entirely surrounded by cold air—not a solid, dense mass as with bricks.

Cover and yoke have been removed to give better view of containers in the Packer. Retailers do not remove yoke when selecting filled containers. Merely life cover and all containers are easily reached.

The Seal

Largest Manufacturers in the World of
Cylindrical Liquid-Tight Paper Containers

ight-Way

Increases Sales of Bulk Ice Cream

A GREATER and more regular consumption of bulk ice cream in the homes throughout the entire year constitutes your most potential and fertile field. The Sealright-Way provides the means of getting your product from your retailers to the homes in an efficient, practical, sanitary, economical and satisfactory manner. It perfects and completes your distribution method. It eliminates the expensive brick system. It enables retailers to handle your product more efficiently and profitably. It keeps and delivers ice cream in perfect condition. Adopted in 44 states, it is proving itself the greatest stimulation to "Carry-Home" Sales ever known to the industry.

TRIANGULAR PACKER.
For Holding Filled Cylindrical Containers in Shipping Tubs and Cabinets.

It is interesting to note how the adoption of the cylindrical paper containers for the distribution of bulk ice cream has brought forth new equipment related thereto. Right in line with this comes the Triangular Packer, made by Oakes & Burger Co., Cattaraugus, New York. It is made of heavy galvanized iron, is simple, durable, and practical. Twenty-two inches high and eleven inches in diameter, it is designed for standard shipping tubs and standard cabinets. It makes a fine shipping proposition and is especially efficient for use in cabinets. The triangular shape permits of a larger icing space, both in tubs and cabinets. It facilitates handling of filled containers by retailers, and allows for increased holding capacity as compared with the ordinary square brick cave. Illustration below shows popular combination arrangement of sizes. Note, also, how all containers come in direct contact with surface of Packer and are entirely surrounded by "cold-air" spaces, thus

assuring maximum refrigeration of all the containers. The Triangular Packer is regarded as a necessary feature by ice cream manufacturers using cylindrical paper containers.

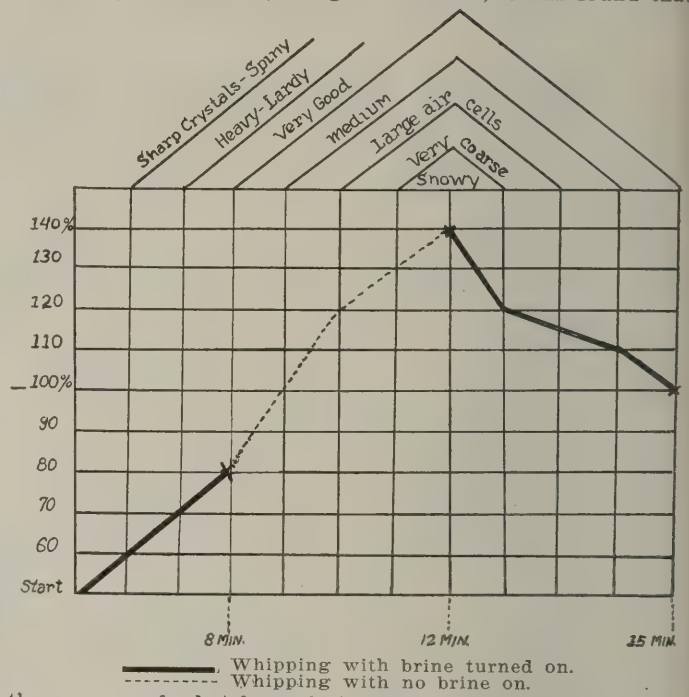
Freezing the Mix

An Important Question Discussed by the Men Who are Making the Ice Cream

THE freezer may be said to be the foundation of the ice cream business; the business grew on the idea of making a cool, refreshing dainty food by freezing it, and on that basis it has continued to grow. Of course, today a great deal of attention is paid to other details of the business because of competition and state regulation, but the freezer still plays a very (if not the most) important part in the ice cream business.



Perhaps two of the most important points to be taken into consideration when freezing are the temperature of the brine and the age of the mix, for upon these depend the texture of the ice cream and the amount of overrun obtained. It was with these facts in mind that we asked several ice cream manufacturers:

"What difference do you experience with a low temperature brine on your freezer, reducing your cream to the proper temperature, then turning off the brine, whipping up to the desired overrun in a shorter space of time than is ordinarily required with a temperature brine?

"What difference do you experience in freezing cream from a freshly homogenized or viscolized mix as compared with one that has been aged 24 to 72 hours?"

The replies follow.

We have found it bad practice to draw a freezer which has been frozen and then whipped up with the brine off. It is possible to whip a mix up, providing it is of right viscosity, to a high overrun, like whipping cream, without the use of any refrigeration. In order to have a product which will freeze firm and hold up, it must be chilled during the process of freezing. The mix containing the average amount of fat and total solids will usually reach its peak in swell when around 27 degrees or 28 degrees F. To shut off the brine and then whip up prevents the batch from reaching this necessary temperature. It will likely warm up considerably more in the process and be of an uneven consistency, causing large air cells or pockets. This, when put away in the hardening rooms or packed may settle or shrink, leaving the cans partly full. The practice of whipping up often leads to too high an overrun which cannot easily be controlled. In fact, by actual tests, using this method, it was found that

the overrun of a batch would increase as much as 20 per cent while being drawn from the freezer. Freezing with a medium temperature brine and then killing the overrun to the desired amount, and throttling the brine valve to maintain that overrun, makes a much more satisfactory product in every way, although it takes a trifle longer. Since following this procedure we have experienced no trouble from poor consistency or with sinking in cans. Herewith is enclosed a chart showing the variation of texture in relation to overrun during process of freezing with brine on and off. This experiment was made on several batches, using freshly made mix, with which it was hard to get the desired amount of overrun. A Miller 40 quart Pyramid freezer was used with 10 degree brine. Samples were taken at every 10 per cent range in overrun, using a Mojonnier tester, and then set away in the sharp room for 48 hours before inspections were made.

The samples taken at 60 per cent overrun showed sharp spines and crystals throughout. At 80 per cent, the ice cream was very heavy and soggy. At thos point the brine turned off and the process of whipping up continued. From here the overrun increased rapidly with a tendency to become more sloppy. At 100 per cent, texture was not so good, there being present many small air cells. At 120 per cent, there were many large air cells which increased to a coarseness at 130 per cent. At 140 per cent, the batch in freezer was quite sloppy. The texture of this sample when hard-cream was very heavy and soggy. At this point the brine was turned on again, after which the consistency of the batch thickened quickly as the overrun dropped. At 100 per cent, consistency of the batch was very thick and would hardly run out of the freezers. The hardened samples from this batch were very fine in texture, being both smooth and creamy and the air cells were small and even.

These results show that the cream taken at 100 per cent at the end of the freezing process was of better quality than that of 80 per cent. What little time that can be saved by the whipping up process is of little importance compared to the improvement of both quality and yield, taking only a few minutes longer to freeze.

A mix freshly pasteurized and homogenized is usually not ripe enough to obtain a good overrun and is quite apt to be of poor texture when hardened. This is evidently due to the temporary hardening of the protein bodies of the mix, etc., brought about by the high heat of pasteurization, which affects the viscosity and retards the incorporation of air in the batch. When frozen without sufficient overrun, the ice cream is of a heavy, soggy texture when hardened, and if whipped up to the desired overrun would come out of the

Getting the Business in Your Own Home Town

"How I Would Do It" by Prominent, Successful Ice Cream Manufacturers and Supply Men

IN AN editorial in the August issue of The Ice Cream Review we told of a visit to an ice cream manufacturer in a medium sized town who is trying to build up a business on a quality basis. This manufacturer is confronted with the difficulty of selling his ice cream in competition with six other plants in his own home town. His business is about three years old and previous to the time he began operations the town was without an ice cream factory for many years. While the brands that are shipped into the town are good they are no better than the local manufacturer's product. This particular manufacturer enjoys a good business in the neighboring towns and wants to know how he can induce his local dealers to handle his ice cream.

Readers were requested in this editorial to give their opinions and suggestions as to how this local trade may be procured. Letters were sent to prominent ice cream manufacturers and supplymen asking them to send in their suggestions, and replies were received from practically every state in the Union. Here is what some of them would do, as told in their own words:

Give Them Super-Service.

The fact there are six different brands of outside cream being sold in his town would indicate that the dealers are somewhat jealous, and are not buying from outside companies fully for the reason that they do not like the local manufacturer, for if this were true, it is very probable that there would not be as many as six different outside concerns represented.

If we are to understand that the local product is of good quality and the personality of the man is not such that would actually drive away business, we would take it that a rilvalry between the different fountains has been caused for some reason or other, and which should be obliterated.

This could be accomplished we believe, in the following manner.

First, by using the proper selling methods and convincing the local dealers that his cream was as good or better than that bought outside, show them the advantage of the service he could render. (We take it for granted since you do not mention anything about prices, that both local and outside are the same). Then appeal to their home town pride, which incidentally is usually of some effect.

Because a dealer usually buys what his customer asks for, let the ice cream men advertise direct to the consumer.

After he has convinced the dealers that he can serve them in the way of quality, price and service, and besides have a demand for his cream from the consumer, then go about to eliminate any rivalry that may exist as mentioned above.

Endeavor to convince the dealers that the fountain across the street is not a competitor but a co-operator. Let him preach the gospel of "eat more ice cream." He can show the dealers that with the support of the local fountains he could advertise more extensively and not only create a demand for his own brand of cream, but to educate people to buy more of it, because they eat more of it. Let him cooperate with his customers by making special flavors for certain Sundays and show them that he is in position, and will increase their fountain business. A druggist or grocer does not hesitate to handle a product which is also handled by his competitor if there is a demand for it.

It may be that these plans have already been tried, although the writer is inclined to believe that there is something wrong with the man personally or with his business methods if they are not successful.

* * *

COMPETITION PROBLEM.

Beginner at Disadvantage.

The conditions as stated are to be found in every town of medium size and are conditions that have to be confronted by every manufacturer who attempts to start an Ice Cream Factory in a small place.

As a rule these small town factories start in a very modest way with a limited amount of equipment and are not prepared to make a high grade product. The dealers on the other hand have been using Cream from factories in the larger near by cities who have all modern and improved machinery for the manufacture of high grade cream. These dealers can detect the difference in the quality of the manufactured product from the small manufacturer.

The greatest hindrance to the success of the small manufacturer is the disloyalty of the consuming public of the town of the small manufacturer who will patronize the dealers that buy from the outside manufacturer and in a good many cases will insist on their buying away from home and will patronize only the dealers that do buy out of town. We have been fighting this very same thing for ten years and have not entirely eliminated outside buying although practically so.

We did not make much headway at it until we bought all modern machinery and now successfully compete with any and all manufacturers and are able to hold our own with them.

Starting the manufacture of Ice Cream as a side line to the Ice business it has come to be the largest part of our business.

We sum up our success as follows. A high grade uniform product, efficient service, honest and well directed advertising and personal effort.

* * *

Take Notes and Compare.

The matter may have several angles to it. Not knowing the local conditions, it is rather difficult to give you much serviceable information.

The manufacturer in question may not be personally popular in his community, he may not maintain a clean and sanitary plant, even tho as you say, he manufactures a good product.

It does look as tho a man manufacturing an Ice Cream on a par with the other creams shipped in there, is justly entitled to the local business, or at least a large percentage of it. It does not appear to us as being a matter of adver-

HOMOGENIZING THE MIX AT 4000 LBS. PER SQUARE INCH

Many ice cream manufacturers find that best results are secured by homogenizing the whole mix at a pressure of 4000 lbs. per square inch. The only Homogenizer which will permit this pressure and keep it uniform is the Gaulin Homogenizer. This machine is equipped with the Gaulin Spring Homogenizing Valve which permits high pressure and maintains it with no danger from breakdowns.

Visit the 1922 National Dairy Exposition and see the Gaulin Homogenizers in the exhibit of The Creamery Package Mfg. Company.

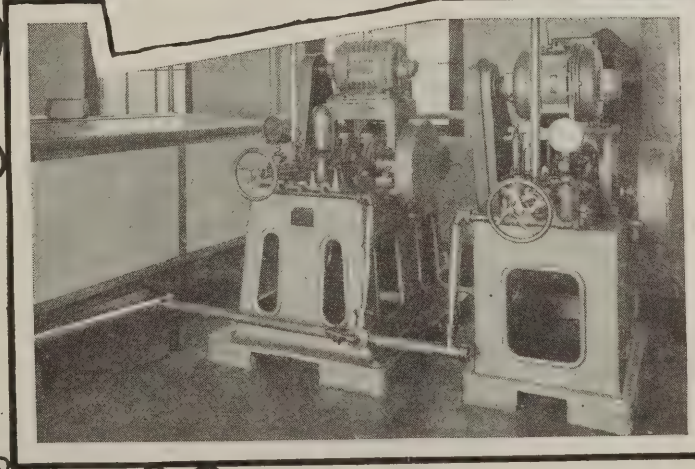
CHICAGO, August 1st, 1922.



The Creamery Package Mfg. Co.,
#61 West Kinzie Street,
Chicago, Illinois.

Gentlemen:

When we started in the ice cream business about two years ago, we felt that we had to make about the best ice cream in the city if we were going to succeed. We were very careful therefore, to select an Homogenizer that would produce the high quality of cream we wanted, and we decided that the Gaulin Homogenizer would best suit our requirements. We discovered that we could submit the mix to a pressure of 4000 lbs. per square inch. As far as we were able to learn this was the only Homogenizer that would give this pressure and keep it uniform.

Because of the excellent service we received from the original machine, we installed another Gaulin Homogenizer this spring. Both machines are giving splendid service.

Yours very truly,
Peoples Fuel & Supply Company
President.

Package Your ICE CREAM in "Purity" Paper Cans

From the freezer to the home in the original container is the "trend" of the times in the ice cream business. The possibilities of the paper container for the pogressive ice cream manufacturer have just begun to be realized.

Note the "lock crimp" of the bottom and side wall.

Strong and Leakproof

The method of constructing "Purity" ice cream packages adds unusual strength and dispels the possibility of leakage thru seams, side walls or bottoms.

That the package method of merchandizing is correct finds no better assurance than its ever increasing application by the most prominent and successful concerns in practically every line.

How the "Purity" package finds application in the ice cream industry is interestingly told in the letters from many users we have bound in booklet form.

Write for copy of booklet on packaging ice cream.

The Purity Paper Vessels Co.

Baltimore, Maryland

Has the Ice Cream Industry a Problem?

WITH the production and sale of ice cream increasing steadily from year to year, the average ice cream manufacturer is reluctant to believe that the industry is faced with any particular problem. If he were asked whether the industry recognized any particular problem, he would probably answer "No" with much emphasis.

On first thought, the negative answer with the performance of the ice cream industry behind it might seem logical, but does second thought bear out the fact? With the power of advertising behind ice cream, we have been educated to know that ice cream is a food and not a delicacy. Taking ice cream out of the delicacy class and putting it into the class of food products was a wonderful move, but how much of a food product is ice cream?

Why Not Saturation?

How much competition does ice cream give such food staples as bread, potatoes or meat? Is ice cream used with as much frequency as any of the staples I have just mentioned and when we answer that question we can most emphatically say, "Ice cream has not attained its rightful place as a food product." Potatoes, bread and meats have reached the saturation point. Has ice cream? IT HAS NOT! Then the ice cream industry has before it the problem of saturation.

The ice cream industry should get saturation to the extent attained by the other staple foods and, though the problem is a gigantic one, it can be done. Saturation is the ultimate aim. How small the ice cream business of today is when compared to its possibilities! Despite its healthy condition, it can only be regarded as an infant industry.

A Selling Fallacy.

I believe that the most important end of the ice cream industry is out of the hands of the ice cream manufacturer in more than 99 per cent of the cases. This end is the control of distribution. No matter how we consider the subject, as long as ice cream is consumed at the soda fountain in the corner store, it is only a delicacy. Saturation can never be brought about through consumption of ice cream at the soda fountain—it must come through home consumption, and the problem would seem then to get ice cream into the home, the same as the baker gets his bread there.

Does the baker put an immense bulk of bread into the corner store to have it dished out in pints, pounds, or what-not? No, but the ice cream manufacturer sends out the greatest percentage of his product in big bulk CANS. Ice cream gets to the corner store and then the manufacturer loses track of it. Is that a safe basis on which to lay the foundation of a permanent industry with the ultimate aim of reaching the saturation point?

"Pinch, Pipeful and Toothful."

Let us take as an illustration the tobacco industry. Suppose the tobacco manufacturer handled his product in the same way ice cream is handled. Assume that he sent fifty or one hundred pounds of tobacco to the corner store, to be sold by the pinch, pipeful or toothful. Where do you suppose the tobacco industry would be? Knowing what we do about the methods of tobacco distribution, the illustration cited for the tobacco manufacturer seems ridiculous.

Now, if you are in agreement as to the ridiculousness of the illustration, then doesn't it seem to you that the actual merchandising of ice cream is just as ridiculous? When ice cream is in the corner store and is put out in cones, sundaes and in sodas, isn't it sold on the basis of the "pinch, pipeful or toothful?"

Understand I do not advocate in any way abandoning the sale of ice cream at the corner store for cones, sundaes and sodas. This consumption is great and always will be, but I do say with much emphasis that ice cream will never be regarded as a food product, as long as its greatest consumption is at the soda fountain.

I claim further that as long as the greatest amount of advertising and selling effort is put on the sale of ice cream at the soda fountain the cart is before the horse.

Packaging Made Milk Industry.

As a further illustration, I believe that the case of the dairy industry can be cited to advantage. Twenty years ago package milk was an unknown quantity. The tank wagon came around to the front door and poured the milk from the faucet into the measure and from the measure into the pitcher, pan or other receptacle which the housewife had brought to the door at the sound of the milk wagon gong. Or, if the milk was delivered early in the morning, the milk was poured into whatever receptacle had been set on the steps. To say nothing of the inadequacy of this system of milk delivery, it was entirely unsanitary.

The growth of the package end of the milk business is a matter of common knowledge, but do you really believe that the milk industry would have been an industry today, had it not been for the individual package service? Therefore, I say that it was the package alone which made the marketing of milk an industry in place of the peddling business that it was for such a great length of time.

The Answer for Ice Cream—

The ice cream manufacturer has an even more difficult situation than the milk industry had, because with the bulk tank wagon deliveries of milk, the deliveries were made on the house to house basis, whereas the ice cream manufacturer's deliveries stop at the corner store.

Then the ice cream industry has the problem of getting ice cream into the home with the same degree of regularity as milk, bread, meats and potatoes and, until that time comes, there can be no saturation.

—Is Purity Paper Cans.

The answer to the ice cream manufacturer's problem is PACKAGED ICE CREAM and the answer to the packaged ice cream problem is in PURITY, the ORIGINAL PAPER CAN, with the famous "locked-crimp" top and bottom construction, as made by The Purity Paper Vessels Company, Baltimore, Maryland.

The Purity Paper Vessels Company will be more than pleased to discuss with you the new possibilities of PURITY PAPER CANS as the ideal ice cream package. You will then be ready for a bigger and better business next season and one step closer to saturation.

W. R. Lenderking, Vice-Pres.

THE PURITY PAPER VESSELS COMPANY.

National Association of Ice Cream Manufacturers

TELL YOUR "WANTS" BY AN AD IN THE CLASSIFIED COLUMN OF THE ICE CREAM REVIEW.

tisement, inasmuch as the cream seems to be popular in nearby towns.

We would suggest that the manufacturer familiarize himself with sanitary conditions in his competitors' plants, compared with his own, and then produce his product with less bacteria than his competitors and sell his goods on that basis; inasmuch as you say the quality, which we presume you refer to as meaning butter-fat and solids content, seems to be on a par with his competitors'.

Sometimes things have to be brought to bear on the local dealers through the local organizations, such as the Chamber of Commerce, Manufacturers' Association, Church Societies, etc. Sometimes the price of a local product is far below that of similar goods shipped in from other towns and that sometimes makes the dealer suspicious that the local product is not as good as the foreign product.

If I were the local manufacturer, I would make every effort to get my product in every church, lodge, and social entertainment held in my community, in order to acquaint my friends and neighbors with the quality of my Ice Cream and their opinions brought to bear on the other dealers will, in our opinion, force them into line.

* * *

Employ A Salesman.

My interpretation of the question asked is how an ice cream manufacturer can sell his product to retailers in his own town when he has competition of five other brands of ice cream—all brands being as nearly on the same basis as far as quality is concerned as could be.

I believe it would be policy for this manufacturer to go to all the retailers handling ice cream, learn of their complaints they have to offer in the way of service, and quality of the ice cream they are using. Then learn of the good points that these five distributors are using. I would then return to my office and decide on a plan whereby I could excel the other distributors on those points offered as complaints by those already using another brand of ice cream and I would then try to better the already satisfactory service rendered by the five other competitors.

I would then go to the various dealers, using my personal acquaintance with them and if I could not sell them myself I would employ the service of a good salesman and permit him to use his superior knowledge of salesmanship and eventually gain the confidence of these customers and procure the business.

By no means would I cut the price to gain this business.

* * *

Start an Advertising Campaign.

If I were in a position of that kind I would first throw my factory open to the public on certain days inviting them to our plant through the local newspapers. I think if this party could get the local people to ask for his brand of ice cream that the local merchants would soon take it on. If he has a first class ice cream factory and keeps same in first class sanitary condition he is entitled to at least 75 per cent of the local business.

I would also take this matter up with the local Chamber of Commerce or some organization of that kind which is organized for the one purpose of looking after local conditions. I would also start a newspaper advertising campaign and in a way try to influence the people to ask for his particular brand of cream. If his price is anywhere near the price of the shippers that are shipping into his town he has a good talking point on the ground that his delivery to their door saves them the expense of telephoning and paying transportation charges on the cream.

We, being shippers of ice cream find it very hard to ship into a town where there is a local manufacturer. In the first place there seems to be a tendency for dealers and consumers to want to use local made ice cream and they always holler to us about saving the express charges and furthermore only having to buy just as they need it. I think this man who you speak of in your letter has many good talking points to argue against the local dealers who insist upon shipping in their ice cream.

* * *

Put in Retail Department.

This is probably the experience that most every other manufacturer would be up against were he to start in business now or had he started in the last two or three years. The dealers settle upon a source of supply and they build up their retail trade on that particular cream. They have had relations, many of them, for a period of several years with their manufacturer and they don't like to take over a new product in the face of their experience with their present product. They have been on very friendly terms with the manufacturer who has been supplying them, at least the dealers of any repute and who are worth while having. The representative of that company calls on them regularly and in that way he is held in line.

We can hardly advise anyone how to get this business except to appeal to the dealers' sense of duty to the home manufacturer if there is any particular feeling of loyalty to their dealers home town. Then these dealers will use his product even though it were considerably lower in quality than his competitors. That is about the best way of approaching the retailers in their home town as far as we can see.

If they persist in ignoring him, he might force them to buy his product by putting in a retail department at his plant and retailing his ice cream at 10c or 15c per quart less than the going price. He could well afford to do this and by handling bricks and other original packages could probably show as much profit out of it as the wholesale business he would get from the dealers would show him.

* * *

From One With Experience.

I have been in the ice cream business and experienced the same difficulties as the party to whom you have reference. There were six or eight consumers, that is, retail dealers, in our town, and only one of them used our cream. There was another manufacturer of ice cream in the same town, who got all the rest of the business with one exception, and that dealer had his product shipped in.

If I should have this same problem confront me again, I would do all the buying I possibly could from the different retail dealers in the town and try in every possible way, without too much expense, to improve the quality of my cream, build up a closer friendship if possible with these dealers and try to get the Commercial Organizations or Chamber of Commerce — whatever it might be called, to boost for that town and for its manufactured products.

I know of a small town in south central Minnesota, where there is one manufacturer and ten or twelve retail dealers, all of whom are buying from their home factory.

Small Refrigerating Machinery

And its Application to the Ice Cream Industry. By F. B. RILEY, S. B. Member American Society Refrigerating Engineers, Toledo, Ohio.

Progress demands the constant forging ahead in ideas and methods—standing still, is the first step in going backward. We demand as necessities today the luxuries of yesterday. The evolution of a mechanical device or article proceeds slowly, perhaps, but the final outcome is usually a simplified article, devoid of freakish outline or weird engineering practices.

F. B. RILEY.

There have been no new discoveries in mechanical refrigeration, or refrigerants, for a great many years. We have wandered at times from the beaten paths in search of better refrigerants, or simpler mechanisms but in the end have returned to known and proven principles and time and money have been lavished in an attempt to simplify existing devices, rearranging parts, refining first this detail and then finally assemblying these various parts into a sturdily built modern refrigerating machine that departs in no essential from the best practices known to the refrigerating world today.

There are **four** distinct phases or topics that must be discussed while considering the use of small refrigerating machines in connection with retail ice cream cabinets;

1st.—The Ice Cream Cabinet and Soda Fountain.
2nd.—The Delivery Truck.
3rd.—The Refrigerating Machine.
4th.—How the use of the Machine affects the merchandizing of the Ice Cream.

You men who have been associated with the Ice Cream Industry since its early days know the trials and tribulations that beset any industry in its infancy. You have seen this business grow from small beginnings to a great National Industry that is well managed and well financed. You know the crude apparatus that was used in your first small factories and you have seen amazing changes in the technique of your industry. You have wonderful factories now where cleanliness and efficiency are the watchword—you have great refrigerating machines and every modern appliance to help in the manufacture of your product. The best is none too good in selecting the equipment for your plants.

You have progressed from the one horse shay to the five or six ton refrigerated truck—But, you are still carrying around the same old ice and the same old salt in the same little bucket that you did thirty years ago and you ram it down with the same old shelally and grumble in the same old way about the cost of this service. Every Manufacturer, so to speak, is in the same boat, all are icing up the pop and ginger ale, the coca cola, soda water, milk and cream, the drinking water and frequently the back bar where the sandwiches and luncheonette articles are kept nice and cool for the tired business man.

If it were merely to cut the cost of the ice and salt used in icing up your cabinets and soda fountains, I would say frankly, there would be no insistent demand for some better method of caring for this most disagreeable and costly part of your business. The cost of the ice and salt will seldom average more than seven to eight cents per gallon of cream troughout the year,—however, the great insisent demand is **not** merely to lower this cost of salt and ice but the cost of the delivery service in general, including interest on invested capital, depreciation on trucks, cans, cabinets and other service equipment and labor, but to keep your product in better condition **after it leaves your factory door.** This is the real meat of the nut.

The Ice Cream Cabinet.

We will first discuss the average ice cream cabinet as we find them throughout the country. Except in one or two isolated instances I have not found it a practice to use more than 1 and one-half to 2 inches of ground or sheet cork for insulating purposes. The cabinets are skinned down to the least possible use of materials,—perhaps, as some may say, because the space is limited in the average store where these cabinets are to be placed,—yet some of the manufacturers that have been loudest in their condemnation of the Soda Fountain Manufacturer who uses an inch of cork and an inch of marble for insulation, have been the worst offenders, if I may use that word, when it comes to a good, sound well insulated cabinet of their own construction.

There may be some manufacturers who use more

At present low prices for retinning Ice Cream Cans you can make a very decided savings over the purchase of new cans.

Take advantage of this service, have your rusty cans retinned instead of junking them and buying new cans.

Our price for retinning a five gallon Ice Cream Can is seventy-five cents and ten cents for Covers—about one third the cost of a new can.

Use your old crates in shipping us your rusty cans. Just mark your tags—

Baird Refrigerator Body

Baird Refrigerator Body.
250 gallon capacity,
on a 2-ton
White chassis.

Perfect Refrigeration, Light Weight with Unusual Durability, plus very Favorable Prices, give Baird Refrigerator Bodies their High Standing

DISTINGUISHED authorities on refrigeration and vehicle construction have helped in the designing of Baird Refrigerator Bodies.

This, plus other expert research, and our use of the finest materials obtainable, make Baird Bodies the best refrigerating vehicles produced.

Baird construction of ice-cream bodies provides a 3-inch thickness of perfect insulation on the top, bottom, and all sides of the ice-cream compartment. Genuine waterproofed Balsa covered with galvanized Toncan metal, forms the lining. Vehisote panels, coated on the inner side with indestructible waterproofing, form the outer covering of the body and furnish an unequalled exterior surface for finish and painting.

Result: *a degree if refrigeration throughout daily use not equalled by any other delivery body made.*

Two-inch angle-iron edge and corner re-enforcements, and the use of bolts and brace rods, give Baird Bodies a stability and endurance that put them in a class by themselves.

PRICES range from $675 to $1100, according to size.

WILLIAM F. BAIRD CO.

Executive Offices: 401 Chamber of Commerce

Factory: Winchester, Mass.

than three inches of cork in their cabinets, if there are, I have not come across them yet. Why is it that you all use from six to 12 inches of sheet or block cork in your hardening room insulation and then use only an inch and a half or two inches of cork in your retail cabinets. —surely not because it saves you money, because if this were so, you would use the same insulation in your hardening rooms. The real reason is, I believe, that we are all of us more or less imitative and we hesitate to branch out and do the things that we feel are right to do because competition does not do thus and so. You did not all simultaneously equip 100 per cent with motor trucks, but you all use them now, if not exclusively, at least they form a great part of your delivery equipment.

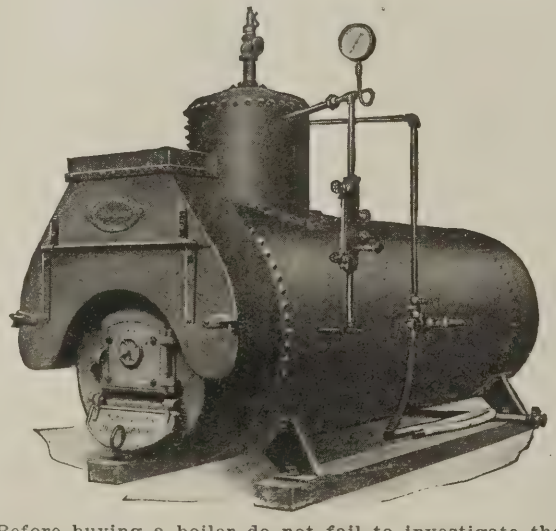
There is more real reason for using four or more inches of good cork or its equivalent in your cabinets than in your hardening rooms. You are trying to maintain, relatively, the same temperatures in your cabinets that you do in your hardening rooms and in a way that cannot be compared in efficiency or cost with the mechanical refrigeration of your hardening rooms. You put loose covers on your cabinets, frequently they are uninsulated, and the lids are invariably uninsulated and frequently poorly fitting, due perhaps to swelling and warping.

For successful machine operation and by this we mean economical and efficient refrigeration, you must begin by making a good well insulated cabinet. Four inches of cork should be the minimum insulation on the sides and bottom and 3 inches for the cover. The lids, should be tight and well insulated as there will be no necessity of removing the cover for icing as it can be fastened tight to the cabinet body, or frame. A splendid cabinet with four inches of cork board insulation can be made and the width kept within 24 inches, and still have sufficient room for the coils of the refrigerating machine.

It is not only possible to handle your bulk and packaged ice cream in much the same way as milk or cream is handled, but we believe that the time is right at hand when practically every manufacturer will modernize this branch of his industry or fall behind in the procession. We realize that you are not going to scrap all of your present equipment of trucks and cabinets, but as you replace this equipment, in some part, at least every year, you can begin with the new methods and gradually you will replace all of the old equipment with the new,—it is time to begin now to modernize this most important part of your merchandizing plan,—viz. the handling of your product from your factory door.

You must think not only to make a better cream but how **to keep it better,** how to get it into the home in better or more usable form,—in other words you must do some constructive thinking in the designing of your cabinets and the insulation of them. The business of your City will eventually gravitate to the man or Concern that puts up the best product and keeps it best after it leaves his **factory.** Your responsibility should not cease at the factory door. It is not merely the first cost of an article that should interest us, **but,** the cost of doing without it.

The sleeve or cylinder for a five gallon package should be one-half inch in diameter greater than the packer itself,—it should be high enough so that the brine which surrounds this cylinder should come well above the level of the ice cream can which is inside of the cylinder. This will prevent the top of the cream from becoming soft. An oval cylinder, or sleeve 19x10 inches wide and 24 inches high will contain two five gallon packers. We suggest the use of direct expansion wherever possible in the cabinets and fountains and the coils, of course are to be submerged in the brine which surrounds the sleeves containing the ice cream packer. It is our suggestion to use a perfectly dry sleeve so that it will be a clean sanitary quick operation to deliver ice cream to the retail store and take out the empties.



Soda Fountain Construction.

The design of ice cream cabinets is a matter entirely in the hands of the individual Ice Cream Manufacturer and you can use any desired thickness of insulation, but when it comes to the design of the soda fountain, you have an entirely different proposition on your hands.

A number of fountain manufacturers already have excellent refrigerated fountain designs and you will find them ready and willing to cooperate with your customers in the selection of a design that will be entirely satisfactory when connected up in series with your refrigerated holding cabinets. As fountain manufacturers come to realize that the future of their business is going to depend on the production of well designed, well insulated fountains, I believe that you will get the heartiest sort of cooperation in standardizing designs suitable for mechanical refrigeration.

The one great drawback to a rapid and universal equipping with mechanical refrigeration is the fact that not one in fifty fountains now in use are suitable for connection to a refrigerating machine. The fountains are not only too poorly insulated for economical refrigeration but it would be a physical impossibility to place coils in the ice cream compartment with an almost entire reconstruction of the fountain itself. The equipment of fountains will be gradual, as old ones are replaced, or new fountains are put into new shops. Never less than four inches of cork board insulation should be used for insulation,—a less quantity will mean high

Bacteria Control

Address of MR. E. G. EMERY, of Royal Dairy Products Co., Bellingham, Wash.

THE title of this paper was handed to me by another gentleman in the shape of a little package and I did not know anything about it until I received the command to prepare it.

Chemistry is really my occupation and bacteriology is really a side issue, that is as to dairy products. I have no interest in disease bacteria. It is necessary to be more or less descriptive, and I have taken the liberty of having a little touch of history first and then description and one or two little points I hope will be of interest.

Bacteriology as a science is comparatively new, practically all of the work having been accomplished since 1860 and by far the greater portion since 1890. In reviewing bacteriology historically four distinct factors are to be considered. A very brief mention of a few items of these factors may prove interesting.

FIRST the history of the miscroscope, for its perfection, necessarily antedated the development of this science.

SECOND the theory of spontaneous generation.

THIRD the germ theory of fermentation and decay, and

FOURTH the germ theory of disease.

Regarding the microscope and the discovery of bacteria. The philosophers of ancient Greece suspected the existence of living beings smaller than are visible to the naked eye but it was not until the seventeenth century that the microscope was sufficiently perfected to allow such organisms to be seen. The first record of such observation was that made by a Dutch lens maker in 1683, who constructed and used a lens sufficiently powerful to enable him to see bacteria in various decaying substances and his drawings were sufficiently accurate to enable scientists today to identify with a considerable degree of certainty the organisms he saw. Another hundred years found microscopes perfected to the point where bacteria were being classified and the class characteristics studied. Still another hundred years brings us to 1883 when the methods of culture and staining of bacteria, such as are used today in a modified and improved form, were introduced.

The theory of spontaneous generation existed in ancient times and the middle ages and it was commonly believed that many forms of life simply sprang into existence from their common environments such as frogs and ducks emerging from the mud of ponds and streams; vermin from all kinds of decaying organic matter. Not until about 1668 was this idea seriously questioned, when an investigator, by placing a screen over a jar containing meat, noticed that magots did not develop in the decaying meat, when the flies were kept away. Later it was noticed that decaying organic matter swarmed with bacteria which led to the natural assumption that they spontaneously formed as a product of the dead cells. Supposed proof of such development was furnished by boiling some meat or vegetables, whereupon it was frequently found that organisms developed.

It was assumed that boiling was sufficient to kill all organisms and that their development in the boiled matter proved the contention of those who believed in spontaneous generation. We now know that some common species of bacteria may not be destroyed at this temperature and that the spores which they form are not, and these spores await a proper time for their development and then blossom forth to function.

The germ theory of fermentation and decay was, after many years of controversy among scientists, finally and firmly established by Pasteur. He succeeded in showing that, among other things, alcoholic fermentation was due to yeasts and the souring of milk to bacteria and since that time the evidence has grown until now we know that putrifaction, fermentation and decay in general are due to the growth in micro-organisms and in most cases the particular forms responsible have been isolated and studied. These facts aided also in the development of

The germ theory of disease which has determined, largely the direction and magnitude of the growth of modern sanitary science. As this last phase of the subject is not of direct interest, we will pass to a closer consideration of the bacteria themselves, and their control.

Bacteria are a single cell organism—the lowest and simplest form of plant life. Although there are countless varieties they are divided into three groups, according to their form, the bacilli being rod shaped, the cocci are round like balls and the Spirilla are spiral shaped. The names apply to the forms of the individual cells which may grow in clusters, chains or other definite form and serves as one means of identification of the organisms.

Bacteria multiply by just increasing in size a cell wall forms, dividing the original cell into two new organisms, which are called daughter cells, and which may break apart forming two simple rod shaped cells, or may, where the division of cells takes place in one place in one plane, continue to form chains. The Cocci, or ball shaped type, contract in the middle, where the

Mojonnier Means

LAWRENCE ICE CREAM Co

CHICAGO

January 27, 1922.

Mojonnier Bros. Co.,
Chicago, Illinois.

Gentlemen:

We have been using the Mojonnier 60-inch Vacuum Condensing Unit for a year and find that it is all you claim for it and MORE.

By its use we can make a BETTER MIX AT LOWER COST. The mix is superior in that it does not require so great a quantity of flavoring extract. The off-flavors are driven off and the natural sweet flavor of the milk only is retained.

We consider the Mojonnier Vacuum Condensing Unit one of the most valuable pieces of equipment in our plant. We heartily endorse it.

Respectfully yours,
LAWRENCE ICE CREAM COMPANY,
By Louis Ahn Pres.

The Mojonnier Vacuum Condensing Unit Standardizes the Flavor

1st. It uses fresh milk products.
2nd. It eliminates heating and reheating or pasteurization and repasteurization.
3rd. It eliminates any off-flavors by vigorous ebullition under vacuum.
4th. It eliminates any possibility of cooked flavors. No product used is heated in excess of 145° F.
5th. It seals in the good flavors.
6th. Less flavoring is necessary since there are no off-flavors to neutralize.

And in Addition It Soon Pays for Itself, Because—

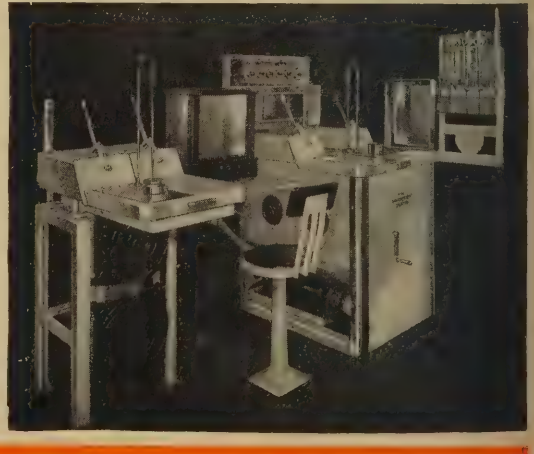
1st. **It effects a saving as high as 12c per gallon of mix.**
The chief reasons for this saving are that fresh milk direct from the producer is used, no product is handled twice, and during the months of peak production butter prices are the lowest.

2nd. **It solves the surplus problem.**
During the period of low production, surplus milk can be converted into sweetened condensed milk or other condensed milk products for which there is a ready market.

The unit consists of the following: Vacuum Pan with all pipe fittings for the use of either or both live and exhaust steam, Hot Wells, Vacuum Pump, sanitary fittings, and all accessories necessary for a complete condensing unit.

A compact unit, requiring small amount of space. Simple to operate.

A 12-page circular giving complete details and technical data furnished on request. It will pay you to investigate and compare costs with your present method.



The Mojonnier Milk Tester Standardizes the Butter Fat and Total Solids

1st. It enables you to test your raw materials.
2nd. It enables you accurately to standardize your ice cream mix.
3rd. It enables you to put out a uniform product.
4th. It prevents loss from too low overrun caused due to insufficient solids not fat.
5th. It prevents "sandiness" and other defects due to high solids not fat.
6th. It is the only effective means of control of your mix.

The Hydrox Company state their Mojonnier Tester pays for itself in a month. Many others who keep accurate records and know, report the tester pays for itself many times over.

Write for descriptive circular.

Look for me and other Mojonnier Dairy Exposition to be held at St. Paul— at the National Exposition for the Ice Cream Industry

Standardization

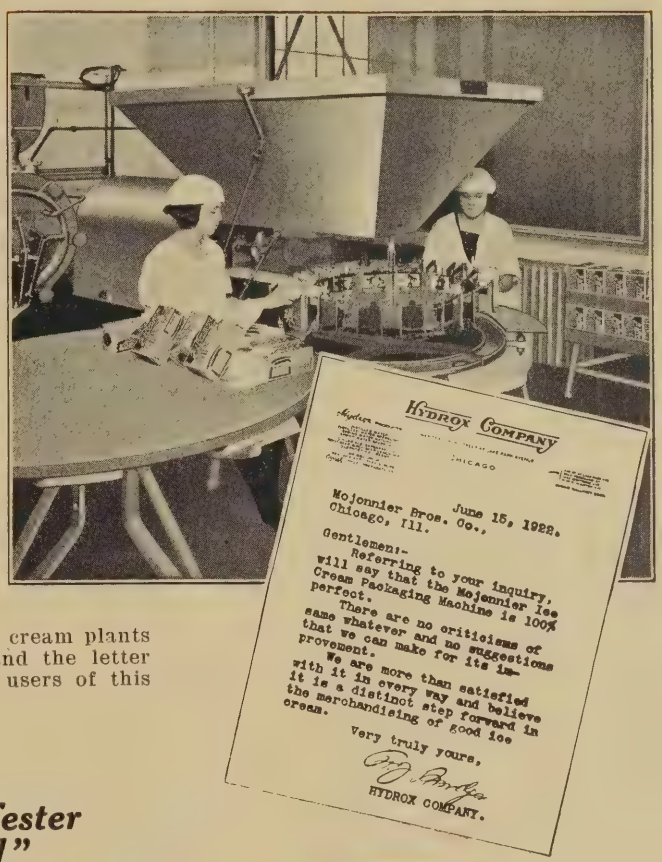
The Mojonnier Packaging Machine Standardizes the Package

1st. It fills an accurately measured amount. No overweight or underweight.

2nd. It fills any size or shape carton. Quarts, Pints, Individuals, Carry-Home Pails or Round Containers.

3rd. It fills either one, two or three layers.

4th. It eliminates air pockets.



5th. It eliminates a large amount of labor, chiefly the following: pouring into molds, dipping, cutting and wrapping.

6th. It saves time and expense.

7th. It insures a sanitary package. Human hands do not touch the ice cream at any time.

8th. It improves flavor and texture. The frozen product is not exposed to the air after filling.

9th. It prevents loss of ice cream.

The Mojonnier Packaging Machine is now in use in over fifty ice cream plants thruout the country, where it is giving universal satisfaction and the letter illustrated above is only one of many received unsolicited from users of this machine. It will do the same for you.

Write for circular giving complete details.

The Mojonnier Overrun Tester Standardizes the "Swell"

1st. It insures standard amount of overrun.

2nd. It prevents loss thru low overrun.

3rd. It maintains quality thru prevention of excessive overrun.

4th. It is built for the freezer room, being steam proof and water proof.

5th. It is accurate, enabling close control of the finished products.

6th. It is durable. Built to last a lifetime, all delicate parts being well protected.

7th. You obtain the per cent of overrun while the ice cream is still in the freezer.

Each per cent of overrun equals .4c per gallon of mix. An average increase of 10% overrun on 100,000 gallons per year represents a saving of $4,000.00.

In use throughout the country by the smallest as well as the largest manufacturers.

Write for circular.

BACTERIA CONTROL.

(Concluded from page 40)

division wall occurs, breaking at that point into two separate balls, or like the Bacillus, forming chains or clusters. The general characteristics of the foregoing groups are true of the Spirilla, occasionally the rod, or Spirilla type may multiply lengthwise.

The size of the bacteria average about one twenty-five thousandths of an inch, which of course means that 25,000 placed end to end equal one inch. It is their power of multiplication by division, as mentioned, that is significant. Their minute size would make them harmless enough if it were not for their extraordinary power of multiplication. This power of growth and division is almost incredable. Some species, under favorable conditions, grow so rapidly as to divide every half hour, or even less. In one day one bacterium would produce over 17,000,000 descendants, and in two days about 281,500,000,000. This number, if it were possible to gather them together would fill a pint measure solid, and would weigh about a pound. At the end of the third day, if nothing happened to check their growth, the total descendants of one bacterium would equal forty-seven trillion and would weigh 16,000,000 pounds, or 8,000 tons. But of course this could not happen in reality, for long before the descendants reached even into the millions, their rate of multiplication is checked by either a lack of food or by an accumulation of their own excreted products, which are injurious to them. Nevertheless these facts go to illustrate what an unlimited power of multiplication these organisms have and this shows that in dealing with bacteria, we are doing business with forces almost infinite in extent. This power of growth is chiefly due to the fact that bacteria feed on highly organized food already in condition for absorption. Other more highly organized plants, have to make their own foods, from simple substances, water or carbonic acid gas from the air, which accounts for their slower growth.

The rapid growth of bacteria, in such masses, in food substances is certain to produce chemical changes in them, as portions are removed and absorbed by bacteria for their nourishment, and again replaced by their products of their activity. It is thus shown how, for instance milk changes from fresh form to the curdled, and perhaps foul smelling mass, as it gets older, or how we suffer from disease when bacteria feed on the body tissues and poison us with their excreted products, which find their way into the blood stream.

There are some species of bacteria which form spores. These are usually of the putrefaction type. The contents of the organism collect in one end, after which the body of the bacteria commonly breaks up and the oval or spherical bodies are set free. These are the spores. They are the resting forms and their functions of adversity. They may be dried for months, or even years, without losing their power of growth. They may be heated to a temperature considerably above boiling water, without injury, for if they are later brought into proper conditions for growth, the spores germinate and develop new organisms, like the original that produced them. They are evidently designed by nature as a safeguard against the extinction of bacteria of that class. It is thus seen that any pasteurizing process will fail to kill spores, and since most bacteria which produce off flavors and other undesirable conditions and changes in milk or cream, are spore formers it becomes evident that some control over these species should be exercised.

To complete this passing description, it may be said that regarding the need for oxygen, which is necessary for all life, bacteria are divided into three classes:

(Concluded on page 60)

Speed Up
Your Brick Cutting Dept. with a "New Era"

Cuts standard ice cream slabs from molds into quarts, pints or any size desired, as fast as the operator can release the ice cream from the molds.

Can be adjusted to cut slices for Chocolate Coated Ice Cream Bars and Picaninny Freeze.

Absolutely Uniform

and unfailingly accurate is the "New Era" Ice Cream Brick Cutter. It's simplicity, speed and accuracy.

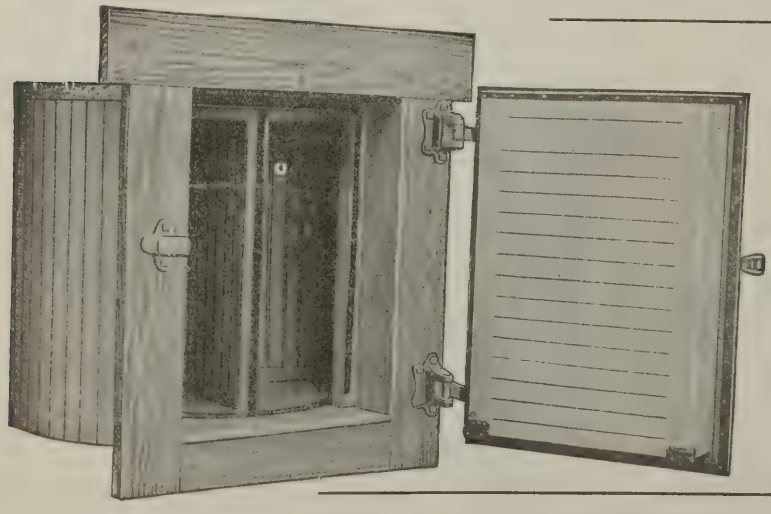
Observations

Address by WYN B. MORRIS before Pacific Association of Ice Cream Manufacturers.

I WILL get out in the open and look and talk to all sides at once. My topic, as usual, was picked for me by my amiable friend Bert Walker, and I learned I am again to give some observations probably along the lines that I talked in Portland last year. The subject fits as easily as an old shoe and I do not have to stick to my text and I do not have to read any paper. All I have to do is to chat along and try to amuse and entertain.



WYN. B. MORRIS

This is the third time I have attempted fate by addressing the Pacific Ice Cream Manufacturers' Association by firing a speech at them. Aside from the loss of copious perspiration I have suffered nothing from those attempts. My family rather figured it was brave of me to attempt a third talk before you. Each time in the past I have wired them that things were going well and they have hopes tomorrow morning. (Applause and laughter.)

I well remember my first appearance before this association in Spokane. I was programmed to speak immediately after the lunch adjournment, and I might say in passing that lunch meant nothing in my young life. I sat in the back part of the room waiting to be called and feeling my speech oozing quietly away from me moment by moment and I was wondering whether I should sneak out the back door or jump through a window, and right when I was at the lowest ebb of my enthusiasm in came Fred Martin's daughter and tore off a perfect corker of a speech, and right after that the Chairman called on me.

There is no more bewildering thing than to follow a good speaker on the program and as I went down the aisle I felt like the young attorney the story tells about. He had just hung up his shingle in the little town and there had preceded him in some way the reputation that he was a silver-tongued orator, which he was not. The town was soon to celebrate its anniversary and he was to make the speech of the occasion. He prepared the speech and memorized it and spoke it over to himself and in the stillness of his room he stood before his mirror, even as you and I—and orated for the occasion. He planned to get off the big speech on the big day and when the time arrived it found him very nervous. It found him seated on the bunting-covered platform with all the prominent men of the town about him and out before him the audience waiting for his speech. He stepped out and began. "Ladies and Gentlemen, forty years ago this was a howling wilderness," but the speech had left him. Bracing himself, he said again, "Ladies and Gentlemen, forty years ago this was a howling wilderness," and still nothing would come, but again, shaking himself together and taking a most dramatic attitude, he said, "Ladies and Gentlemen, forty years ago this was a howling wilderness—and I wish to God it was now." (Laughter.)

I know his embarrassment, but even then I was not quite so much emmarrassed as the minister in our town who was suddenly called on to preach a funeral sermon. The other minister was away or had had tire trouble (laughter), or anyway, was not there, and this young minister was called upon suddenly to make the funeral address. He had had very little information and was even ignorant of the sex of the departed, did not know whether it was a man or woman, and he knew the time would come in his talk when he must refer to the departed—when he must say something that would require this information. In his desperation he looked down in front of him and saw a mourner and he stopped a minute and leaned over to him and whispered "brother or sister?" and the mourner said "cousin," (laughter) leaving him high and dry and hung up. Last year when I was in Portland I made bold enough to say that in the course of my travels I met many ice cream manufacturers. I pointed out what I thought were some of their little fallacies and foibles, and I told them they did not get far enough away from their business and seek relaxation at times; that they were too much cluttered up with details and did not play enough, and rashly and very unwisely indeed I said, "Why don't you play golf?" and I want to say in passing that advice was taken. When I appeared at Portland last May George Burt and John Williams dared me to come out and play golf, and to my surprise the fourth member of

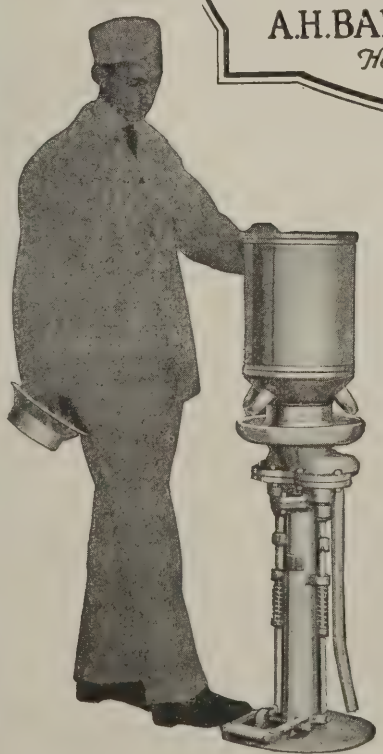
Foot-Power Filler

Sealright—a Practical Filling Machine for the Round Container

The Sealright Filler, with the Sealright Containers, forms the finest combination on the market for speedy and thoroughly satisfactory work. The machine is compact and fits in anywhere. It automatically packs bulk ice cream in one or or more flavors without the necessity of the cream being touched by hands. Bulk cream in packages is what the people want. Be a leader in your community and win popular favor by supplying bulk cream in the Sealright Package.



Sealright Containers

appeal to the ice cream buyer, for their carrying and keeping qualities, and because they do away with the mussy, unsatisfactory method of unwrapping and slicing the usual brick. And more important still, they protect the dealer against loss by measuring the cream accurately —four quarts from every gallon, instead of the shortage that always results where bulging paper pails are used.

BARBER

IF you want to keep closely in touch with the latest developments in equipment and supplies for your business, you have only to keep your name on the Barber mailing list. As large distributors, we keep fully informed on new machinery and improvements brought out by the various manufacturers, and the things which are practical and worth-while are quickly passed along to our customers. This, with our Chicago and St. Paul locations, and our excellent shipping facilities, is a great convenience and valuable to the dairy industry throughout the Middle West.

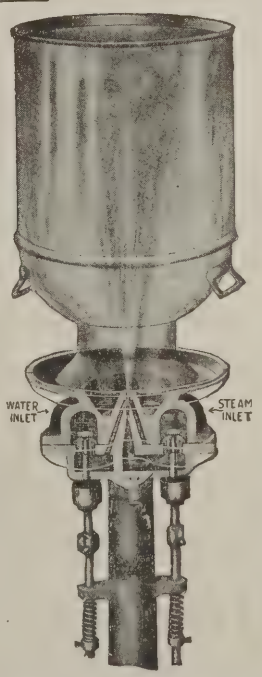
TWIN CITY OFFICE: 2490 UNIVERSITY AVE., ST. PAUL

Danforth Jet Rinser and Sterilizer



A can steamer, to be satisfactory, must be fast—thorough—and convenient in operation.

The Danforth steam jet is located directly beneath the orifice. The action of the jet breaks the water into a fine spray and greatly accelerates its speed. The water is heated by the steam as it passes through the ejector.

Note the convenient operation of the valves directing the water and steam. A flexible foot tread, simply by moving the ball of the foot one inch to the right, shifts from water spray to live steam. The rinsing is instantly followed by sterilizing. Nothing could be speedier or more convenient. The hands of the operator are left free to hold the can.

It is low enough in price to make it practical for the smallest plant—large enough in capacity to meet the needs of the plant handling 300 cans per day. A thoroughly practical and dependable piece of equipment at a moderate cost.

Price, painted gray, $45; galvanized, $50

that party was that amiable and accomplished after dinner speaker, Joe Dunne. (Laughter.)

If I may be permitted to drop into the vernacular of the street, I'll tell the world that Joe got far away from his business that day.

He had in his wisdom selected a pair of trousers for that event which had undoubtedly seen better days. As the affair was a simple afternoon function Joe evidently calculated that there would be no lady players on the golf course, and he did not discover until he was well out from the dressing room that the seat of these trousers and the main portion of the trousers had decided to part company. (Laughter.)

Mr. Dunne: That is a fact, too. (Laughter.)

Mr. Morris: I can see yet Joe addressing the ball, looking around to see if anybody was looking, with one hand clasped at that unmentionable point before he struck, and I must say that he had a beautiful flow of language at his command. (Laughter.)

Never again shall I speak rashly of golf to my friends. Jack Simonson hauled me over a course when I was over in Yakima, and I firmly believe that perhaps George Weatherley and our good friend Martin and perhaps Bert Walker will take up golf, and if such shall emoe to pass, I say now, "Oh, Lord, let thy servant depart in peace, because I have seen it all." (Laughter.)

Bert said to talk about everything. Seems to be the keynote of many conventions to talk about everything, and I have no particular objection to it. All I can say is that I have no ready-made form of publicity, but if I can leave one thought with you I have accomplished the purpose I want to accomplish. That is summed up in this one sentence. If you will give the same amount of thought to advertising that you give to production, accounting, delivery, or any other major portion of your business, you will be successful. You will do it later if you are not doing it now.

Let me illustrate in this way. I have a good friend in Pennsylvania who is an ice cream manufacturer. He is not a big manufacturer, and quite likely he never will be. He has in his possession the finest collection of cut-outs, signs, cards, posters, that ever adorned a stockroom. Every salesman that comes along unloads a certain portion of his stuff on Bill. It does not follow at the end of the year that he is an advertiser, because his balance sheet shows that he spent so much for advertising, and when I kid him about being an advertiser he froths at the mouth. Now, then, Bills says to somebody around the plant, "Joe, let's get out some of this advertising junk—" and it is junk by that time—and Joe, who knows as much about advertising as I do about breeding pelicans, say, Joe starts out some Monday morning in May and works two hours putting out his advertising junk. The advertising campaign for 1922 is accomplished. (Laughter.)

It is precisely as though my friend Bill had said, "Well, it is cold tonight, Mary," and he goes down to the basement, and shovels four shovelsful of coal into the furnace and says, "Well, we will be warm all winter now."

And I have another friend who has another system. His beginning is to take a three or four inch card in the local newspaper and change the type about three times a week and along comes the program of the ball or the labor movement or the high school and he falls for that. The hotel register prints names around it and his name is there, and along come the ladies with the Beautiful Back Yard proposition, and my friend falls for a full page. At the end of the year he has spent a large sum of money and when I kid him about being an advertiser he also froths at the mouth.

He can hardly expect people to cry for his ice cream with that kind of advertising. He is a darned smart fellow; you could not beat him in a horse trade. He knows what he is doing when he buys machinery, and he knows what he is doing when it is his accounting system, but he knows nothing at all when it comes to advertising.

I have another friend and I had no intention of reading from the paper until it was suggested to me yesterday, but this friend was a doughboy, in the Spanish American war. He got out of that small-bore war with a lot of experience and nothing else. He now owns seven ice cream plants, that is, he did own seven last week, it may be nine now. (Laughter).

At the National Convention he had a special paper prepared and sent me a copy of it and I want to read a part of it to you. He was not there but he had a friend read it for him and it was printed in one of the trade papers. He gives the same proportionate amount of thought to his advertising that he does to any other part of his business.

"Now from what I can observe there is no reluctance on the part of the public to eat ice cream every day in the year if it is offered to them. Every formal dinner, even if served on the coldest winter night, includes ice cream, every hotel continually includes it in its menu and when your wife or my wife plans a dinner party the weather has nothing at all to do with what she serves for dessert.

"Just sitting back and saying 'It can't be done' doesn't seem just right and so with the idea of trying an experiment at one of our branches three years ago, we decided to distribute some of the advertising appropriation for that particular plant over the lean months, as we found the hot weather gave enough momentum in the summer to carry sales along without the additional acceleration that advertising furnished. We started that advertising with the waning of the season and kept increasing gradually until spring business started, when we let down. We made our product just a little richer, gave just a little better service, saw to it that the stock in dealers' hands did not get old, coarse and grany or flavorless, as ice cream will get when kept too long. We also made special flavors to add variety and tempt the jaded appetite.

"To call attention to these specials, we used window streamers and window display even in the coolest weather of the year at the expense of being considered weak-minded. We also had a series of direct-to-the-consumer advertising in the form of announcements, in which was suggested new flavors and novelties in which ice cream could be served in the home, hot sauces, recipes, etc. Our order clerks scoured the papers for notices of lodge, church and other affairs.

Manufacturing Chemists

ST. LOUIS, MO.

"When we took stock at the beginning of the summer season, we found that we had kept more of our organization together than in the previous years; the milk producers were in a sweeter frame of mind, and best of all, dealers were in line and more enthusiastic.

"The following year we tried it out on a second plant, let up on advertising a little at the first plant, but not on the service, and we carried two of our plants through without red figures. Last year, with the help of the weather man, five of our plants increased their sales sufficiently to overcome the usual red figures.

"This fall we have started the campaign on a more elaborate scale.

"I want to stress a little bit the effect of winter advertising on our dealers. They quickly realized that we were out to do something and after a while they took hold too and did their part. Instead of getting listless and indifferent in their service, the winter months found many of them on their toes and when spring came we had team work that accelerated our summer business.

"And another by-product of our advertising which we had not foreseen has been the effect on our own employees. The growing business keyed them up too. They had to live up to the advertising and instead of the rather perfunctory service which they had heretofore given during winter months, why we got pretty enthusiastic work and thereby we kept our organization together through what we commonly called the dull season.

"We haven't been niggardly about spending money, but we haven't been wasteful. Big advertisements cost money but big advertisements have the habit of starting people to think and what we wanted was to get them to think about our ice cream. We also made every possible effort to have the newspaper advertisements kick out of the page. Outside of the big city dailies the general run of advertising is often pretty plain stuff and we figured that clean type, good pictures and a general air of smartness was worth all it cost.

"We are very well satisfied with the results and hereafter I believe we shall stop bothering about the weatherman and go about our business of thinking up ways to make the consumer hungry for ice cream. At the same time we shan't overlook the very important thing of making it possible for him to get it when he has the notion. Thereby we shall help along the general cause of increased business in winter months as well as help ourselves and so far as I have observed this is what we are in business to do.

"I haven't preached a doctrine I don't follow. I haven't preached at all in fact—and this talk is in no sense the imparting of any secret of success. I've tried to tell, in my own way, that ice cream sales can be increased in winter and the proof is the fact that we've done it and expect to keep on doing it."

That is all I want to read out of his paper. He has made a wonderful success of winter business and as I said at the beginning, one of the principal reasons is that he is giving as much time and attention to his advertising as he is to the other branches of his business.

Two merchants were talking one day. One said, "I believe in advertising," and the other one said, "Yes, I advertised yesterday for a night watchman and burglars cleaned me out last night." (Laughter.) It pays to advertise; they all say it.

I should be very negligent, of course, if I did not say something about the cordiality of the welcome that has been accorded me at this convention.

Three years have made me feel at home and that early period of embarrassment has gone. This year has been a little different than other years, but I do not see any gloom present among the gentlemen of this organization. From what I can see it is quite a convention. I am looking forward to coming here year after year. Some day perhaps we shall have a prohibition law in these great United States. It has not reached here yet, I am free to say. (Laughter.) It seems to me to have been a very splendid convention and that everybody has had a fine time and have gotten lots of benefit from the convention. There just lit into my mind an eight line sentence which seems to describe this convention as well as anything else. A little bit of a poem which is found at the end of "Trilby." It seems to fit a gathering like this. It runs:

"A little work, a little play,
To keep us going, and so, Good Day.
A little joy to match the sorrow
Of each day's going, so Good Morrow.
A little trust, that when we die,
We will reap our sowing, and so, Good Bye."

ICE CREAM VALUABLE FOOD, SAYS ILLINOIS 'U.'

Urbana, Ill.—Ice cream is not only a "delicious and dainty dessert, but is a very valuable food as well," says a recent statement from the University of Illinois.

"It contains the muscle-building proteins," the statement continued, "the energy-producing fat and sugar and the bone-making minerals of milk in higher concentration than they are present in milk. It also contains cane sugar, another valuable energy producer.

"Carefully prepared ice cream is wholesome and highly nutritious. Make it at home or buy it already to eat.

"Use ice cream not as an occasional confection, but often as a refreshing, cooling, hot-weather food."

Echoes From the Last National Convention

Address of FRED N. MARTIN

In listening to the remarks made by my friend Wyn Morris, I could not help but draw a little picture to myself about our genial president. Mr. Morris remarked that Joe was playing golf, and that there was some hope for George Weatherly and Bert Walker and even myself in that regard. I could not imagine Joe on a golf course in a kiltie suit. (Laughter.)

FRED. N. MARTIN

That recalls an incident—I only told Joe this yesterday but I want to mention it here. We were out to the Boulevard Inn three years ago when our convention was held here, and a little entertainment was put on by the Supply Men for our benefit. Among the features was an Orpheum troupe of bathing girls. I think there were some twenty in number and it required one suit-case to take their costumes out. (Laughter.)

Mrs. Dunne, during the evening, become very much concerned about her husband. I met her in the main room and she seemed to think that I knew where Joe was, and she said, "Where is Joe?" And I said, "I am not going to tell you." And she said, "I want to know where he is," and I said "It is a secret." Naturally a woman's instinct became uppermost and she was still more curious and said, "I want to know where he is" and I told her then I would tell her providing she would keep it confidential, which she agreed to do, and I think she did. I said, "Joe is upstairs in the room directly above us and they are attiring him in a Hawaiian costume," and she said, "My goodness, I am going home right away." Joe was attired in that costume. (Laughter.)

I am supposed to tell you something with reference to the doings of the National Association. I want to say here, gentlemen, that many of you manufacturers do not appreciate the value of the National organization. As I was saying not long ago to a friend of mine here, if it were my privilege to be a banker, and I had a customer who was an ice cream manufacturer and in a period of stress he needed a little change, I would propound several questions to him before I would accommodate him. One of them would be to learn if he was connected with an organization covering his industry as well as a national one, and if I found that he was not providing himself with that insurance he would never get a dollar.

Your organization, both local and national, is the insurance to your business, and it is as important that you carry that insurance as that you carry any other form of insurance, fire liability, or automobile insurance.

As you know, we are here to exchange ideas and gain knowledge of our own industry. We can accomplish more in one of these meetings than we can possibly accomplish in five years actual work working out our own solutions. The exchange of ideas is much more valuable to us than the exchange of dollars. You and I could exchange dollars forever and still have the same dollar when we were through, but if we exchange ideas we each have two ideas when we complete the transaction and it is easy to see the value when you look at it in that light.

As to the national association, it was my great privilege—and I consider it a very great honor—to have held the position of president of the national organization. I owe it to my friends in the west who went sixty-two strong from the north-west to Chicago, adorning themselves with the colors yellow and blue which are the colors I use in my business, and with the bird, a martin, on display. My friend here even took it up with Washington, D. C., to get the real bird.

It was astonishing to those people from New England and eastern states to see us come that way and the next morning they in turn adorned themselves with a black card boosting the other fellow, but we were successful, and I feel that we had as successful a meeting this year in Minneapolis as we ever had before at the meetings of the national association.

In reviewing the work of the National Association for the past year we had many things that were done in the interests of all of us. Our industry was very much benefited.

* * *

Among the functions of the National Association during the past year was the handling of a number of cases where it came to our attention that substitute fats were used. Action was taken by the association in the matter. The firms were warned first, in case they refused to de-

sist and the matter was taken up with the State Food Commission in the locality in which they were located and it did not take long to have them quit using substitutes.

Another thing the national is going to do the coming year, and a committee has been already appointed and a survey has been made on the following matter. I made this recommendation that it be done, to the new president, that a survey be made of the shipping business to ascertain the exact volume of decrease we have had in our shipping. I believe that the compiling of that information will be astounding to the members of our industry, because the shipping business has very materially decreased, due to the exorbitant rates we are now paying.

My Recommendation was that this information, which will be true in every particular, be prepared and presented to the officers of the express companies and that we use that means of getting a reduction in rates. Since then I have had the opportunity of talking with one express official, a man who occupies a very prominent position, and he led me to believe, if it was handled in that way it would get results, and we could be assured the National Association is going to do everything it can to bring that about, which of course will be a wonderful asset to our industry.

They are also going to take up and ascertain a uniform depreciation. We attempted that last year but we got started rather late and that part of the work was not completed.

I know all of you who belong to the National Association are aware of the fact that the National Association two years ago brought out and developed a uniform accounting system. All members of the National Association are privileged to send to the Secretary and get those blanks. They are very complete and we can all talk in the same language if those blanks are used in compiling and keep our records. That is a wonderful asset and it is really amusing. My Secretary was telling me in Chicago at this meeting that there was one firm in Texas that was so fearful that they would not get those blanks that they sent in money to get a ten year's supply. (Laughter.)

I think that I have conveyed to you in a general way the methods of the National Association functioning in our interest and the work that they are continually doing and I beseech of you, any of you that are not members of the National Association, that you secure blanks from our Secretary here who is provided with them, and that you make application. The cost to you will be so small that you will not notice it at all. You all know it is weight that counts, increased membership, additional weight, and prestige that will be given our national organization.

I might say a recent court decision that I received just before I left home is going to give trade associations a very much larger scope than they previously had. A decision has just been handed down by District Judge Carpenter of the Federal Court of vital importance to all trade associations. The court denied for want of equity the Government's petition for an injunction against the association of linseed oil crushers. The Government charged that a conspiracy existed to restrain inter-state commerce and to add to and enhance and fix prices and was decided against by the Court. No doubt this will be in print and can be had and any of you that are desirous of doing so, it will be well for you to note the matter and get a copy of that decision.

That is one of the most important rulings ever made with reference to trade associations.

I am through with my remarks about the National Association and anyone who desires any further information after I am through with this talk, as to the further functioning of the National Association, I would be glad to discuss the matter with them.

I am now going to diverge a little and it might seem that in a way I am promoting something for myself personally in the matter that I am going to tell you. In my paper at the National Association I made mention of the fact that the ice cream industry had progressed more rapidly in the last five years than it had in the previous history of the industry, making mention of the fact that our present day methods of freezing would soon be obsolete as we would do away with the use of ice cream freezers. I made no further statement but that reference did not seem to pass over the heads of many. It promoted considerable discussion and I was asked a good many questions and I did not expose what I had in mind.

The fact is, in that respect, I own a basic patent and I have been working on the process for the past eighteen months. It is reversing the principle of the patent for drying milk. Instead of drying it we are going to freeze it. It makes one of the finest products you can imagine. It gives better control of the overrun, and does away with the icy ice cream, reduces the expense of the manufacturer from sixty-five to seventy per cent and does away with one third of the packing can equipment and it is a very simple method to operate. In fact, I could go into any plant in the city here and in fifteen minutesI could demonstrate to you the process in a crude way. You can imagine what it is going to do to the industry. It is going to be a blow, of course, to the ice cream freezer men, but it is going to make us better products and I am going to picture something to you a little later in my talk.

But by the way, I am glad to give this information out. It is a western convention and I thought it would

Gelatin users!

Write Swift & Company today

Complete information and samples are ready for you on a line of gelatins so excellent that they have won, in less than two years, a nation-wide demand.

Made by Swift & Company not simply up to established gelatin standards, but up to the Swift standard of quality and uniformity.

In grades to meet your requirements.

At prices that are most reasonable.

Exceptional Quality; quicker deliveries

Stocks are now kept in 12 cities. The nearest of these is your source of supply for these gelatins. Unusually quick deliveries are possible to any city or town in the United States.

Hundreds upon hundreds of ice cream makers and candy makers are now using Swift's Gelatins.

Impelled by the belief that Swift & Company, with all its resources, ***should*** be able to make and market a superior line of gelatins, they got the facts; they judged the gelatins for themselves.

To get samples

Whether you use large or small quantities of gelatin; whether you are in the market right now or not, you are invited to write for complete information and samples of this line. Or, upon request, a representative will call.

Address Dept. 6 C.

Chicago

THE ASSOCIATION OF ICE CREAM SUPPLY MEN · MEMBER

be better to let it emanate from the west and not give it out while I was in the east.

While I was in Chicago I found still further progress was being made along the lines of cutting out expense for their industry the same as this process will do, and that was this: There is a man who has developed a new soda fountain. We have all had lots of fun with regard to iceless fountains. Some friends of mine who are going to assist in the financing of this new fountain took me out to show it to me. The fountain I saw was a ten foot fountain, three inches higher and six inches wider than the ordinary fountain. One of the patented features of it was the cabinet in the fountain. It had fourteen syrup pumps, double arms, and the lids in the packing box were made like this. (Indicating.) That is, there were fifty gallon ice cream compartments in the cabinet of this ten foot fountain. The files were directly back of one another. To reach the rear can he lifted a lid this way (indicating); to reach the further can he lifted the lid this way (indicating). You can see how readily such a fountain can be worked. The real feature of the fountain is this. It had a miniature ice machine, as I would call it. I presume it was twelve inches wide, fourteen inches high, and about four inches thick, double cylinders about that size (indicating), the base possibly twenty-four inches long, eighteen inches wide and four inches deep, that was the ammonia receiver and contained two pounds of ammonia. The machine was running from an electric light cord and the cabinet was piped from that machine which it was operating on. The machine had not been stopped for ten days. They had a watchman there, the men who were going to put the money up were satisfying themselves what could be done with it. The room, about twenty by fourteen, an ordinary little fountain room, they had a stove in that room and they were maintaining a temperature of from seventy-five to eighty degrees constantly. That, of course, was to test the energy that the machine would produce and how it would keep the ice cream. I saw it after it had been in continuous operation without a shut-down for ten days. The ice cream was then in the finest condition. The same ice cream was in the cabinet. I believe it is the intention that they are going to market those machines, that fountain and machine complete, for fifteen hundred dollars.

See what a revolution this is going to bring to our business. Here is a fountain that will contain fifty gallons of ice cream properly refrigerated at all times. It is another short cut to cut out delivery expense. No doubt there are places where fifty gallons of ice cream will last a dealer a week. Others would consume that much in two or three days but it will cut the delivery service in two.

With the use of refrigerated delivery boxes it means that no ice or salt will be used.

We will give a hard blow to the ice and salt men if this is worked out, which we think it will be. That means your plant would act as a pump and force a spray into a room holding the ice cream and it is put out by actual weight and you can put it on the wagon and immediately send it out. Could you imagine a more drastic change in our industry than I have told you about.

BIG CALIFORNIA FIRM BEGINS CONSTRUCTION OF PLANTS.

The Consumers Milk Company, a $500,000 corporation recently organized in Los Angeles, Cal., has begun the erection of their first plant, which is at Long Beach, Cal. The Long Beach plant will cost approximately $50,000 and will have a capacity of 3,000 gallons of ice cream daily, besides taking care of a large fluid milk business. Although construction of the plant has only just begun and it will not be ready for operation until October first, the firm has contracts for the daily sale of 15,000 gallons of ice cream. The building will be a first-class 50 by 110 foot brick structure and will be equipped with the best possible modern machinery. E. S. Acres, a very successful local business man, is to manage the plant.

Construction of a plant in Los Angeles, the estimated cost of which is $250,000, is soon to begin. This plant has already contracted a daily market for 6,000 gallons of milk.

The officers of this firm are: O. R. Lee, Los Angeles, president; C. H. Osborne, San Bernardino, vice-president, and Homer Lawton, Los Angeles, secretary-treasurer; and the officers with E. S. Acres, Long Beach, and W. H. Rapson, Corona, constitute the board of directors.

Mr. Lee, president, was formerly manager of the Centralia Creamery Company which has large plants through the south and southwest and was identified with the Columbia Products Company in the northwest; Mr. Osborne is manager of a large farming company and a former professor at the Michigan College of Agriculture, and Mr. Lawton is connected with a large Los Angeles hotel, having formerly been manager of other hotels and restaurants.

Tell us what you want, or what you have that you don't want, and we'll fix up a little ad. for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

Commercial Truck Company,
Philadelphia, Pa.

Gentlemen:

We hand you herewith our order for one hundred and seventy-seven two thousand pound Model B -2 C- T Electric Truck Chassis, to be delivered as specified.

As you know, we have had in our service several other makes of electric trucks during the year we have had six of yours. We have awarded this contract to you strictly upon the performance of your truck, and upon your service. We are glad to compliment you upon both.

Yours very truly,
THE WAGNER PASTRY COMPANY.
By William Bittles, President.

WB:O.

The Largest order ever placed for Electric Trucks

The performance of these C-T Electric Trucks together with C-T service won the order for 177 additional trucks. Read Mr. Bittles' letter reproduced above.

Grand Rapids Firm Important to Progress of Dairy Industry

A business re-organization worthy of attention took place in Grand Rapids last spring, when B. A. Yarrington and H. V. Walsh, proprietors of the Grand Rapids Manufacturing Company, joined forces with W. G. Finch of the W. G. Finch Company, Inc., making the company a $250,000 organization. The trustees of this new company are Mr. Yarrington, president; Mr. Walsh, vice-president, and Mr. Finch, sales manager.

When the Grand Rapids Manufacturing Company was first organized, they built special machinery for every purpose imaginable, not concentrating on any one line. Later they began specializing in devoloping and perfecting pneumatic water systems. Their special machinery brought them more or less in contact with the dairy industry to which they are now a valued addition.

Mr. Yarrington has held several important executive positions with various manufacturing concerns. About four years ago he resigned as chief designer of the Oliver Machinery Company of Grand Rapids to go into partnership with Mr. Walsh for the manufacture of special machinery.

H. V. WALSH.

They were very successful in this, and were able to develop and perfect several new machines. They hold valuable patent rights on a visible gasoline meter for measuring of gas at filling stations, patent rights of the filing machine for die and tool work, and the Artesian Pure Water System.

It has taken several years to develop and perfect this water system pump, but at the present time its performance is nothing short of wonderful. It was originally intended to supply farm homes with a convenient and reliable water supply, but demands for larger capacity pumps have made it necessary for them to build pumps large enough to satisfactorily take care of dairies, milk plants, condensaries, etc.

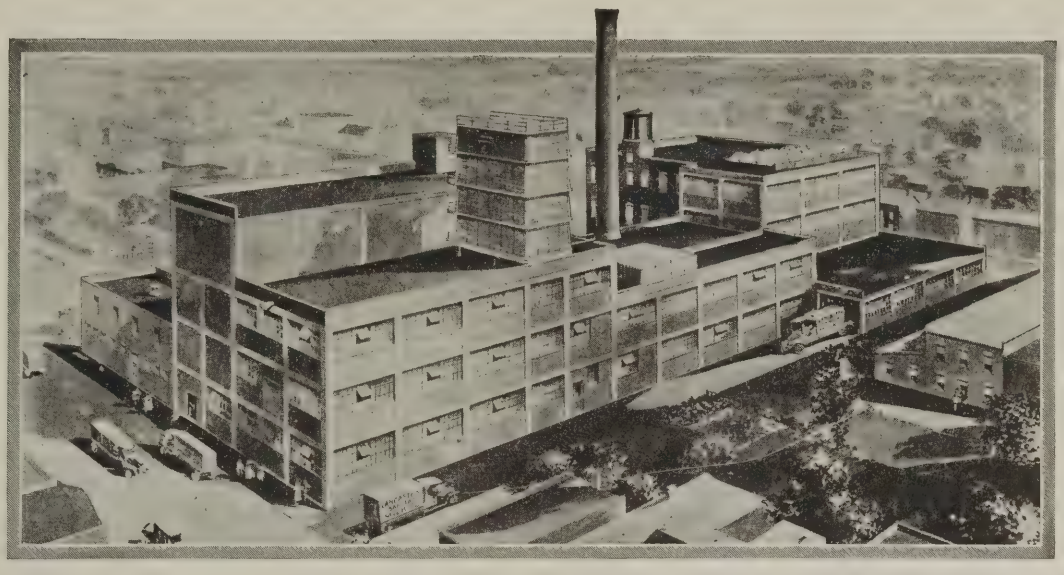
Mr. Walsh has a record of being a very efficient production manager, and has held several important positions in various parts of the United States. Just previous to his going into partnership with Mr. Yarrington, he resigned as superintendent of the Oliver Machinery Company, after being associated with that organization for about five years.

Mr. Finch has been interested in dairy machinery ever since he has been in business. His most recent invention is a new fluid scale, which is filling a long felt want in dairies, creameries, ice cream factories and condensaries. It gives such plants a reliable check on the pounds of milk, condensed milk, cream or mix with which they supply the various departments. It is inexpensive, and very efficient.

When Mr. Finch had perfected this scale and began making plans for a factory to produce it, it was discovered that it would be mutually advantageous to effect a consolidation with the Grand Rapids Manufacturing Company. The outcome is the present organization.

B. A. YARRINGTON.

C. A. BEIGLE.



WM. G. FINCH.

This company now manufactures tubular coolers, ice cream mixers, pasteurizers and bottle washers, liquid weighing devices and artesian pumps.

The dairy industry is to be congratulated in having men of this caliber interested in designing and building dairy machines. They are progressive and foresighted, and make it their aim to anticipate requirements, hence are frequently a step in advance of the general market in supplying dairymen's needs.

One of the important sales representatives affiliated with this company is C. A. Beigle. His territory covers the rich dairying state of Wisconsin.

This company promises a few minor and one major surprise in the way of dairy equipment to be exhibited at the National Dairy Exposition in October. The nature of this machinery is not divulged, but it is sure to be something ingenious and practical, therefore it would be to the interest of dairymen to visit this exhibit.

Lancaster Sanitary Milk Company, Lancaster, Pa.

Irregular Properties

Are Often Satisfactorily Utilized Without Acquiring Additional Space

AN owner may have a very peculiarly-shaped property in a good location—perhaps adjoining his present plant—and it may be limited in size for the extra capacity desired. He may have a certain location in mind which he thinks is necessary for his purpose but is waiting for its cost to go down—meantime jeopardizing his business growth.

In many cases McCORMICK engineers have pointed out the utility and possibilties of their present space, thus permitting of immediate expansion at a material saving in cost.

We have been confronted with numerous irregular-property problems and have never failed to answer them satisfactorily. Our many years in the ice cream and dairy field provides a wealth of experience and engineering skill for plant owners to draw upon.

Our business is to co-operate with you to the fullest extent in the solving of your construction problems. We will be glad to have you confer with us and you will be placing yourself under no obligation by so doing.

The building pictured above is the extension made to their old building at the extreme right of the picture. The building we designed contains a complete ice making plant with an exceptionally large ice storage, mixing room, hardening rooms and an excellent shipping platform and truck yard.

With all of our contracts we invariably give an estimate of cost, and the estimate submitted for this building worked out in exact accordance with the competitive estimate they later received.

BACTERIA CONTROL.

(Continued from page 45)

Those which live in contact with the air only are called aerobic bacteria; those which live only out of contact with air and derive their oxygen through decomposition of some substance containing combined oxygen on which they feed, are called anaerobic bacteria and are usually spore formers, and often produce gas; the third class are called faculative, since they can adapt themselves to either condition.

The filth and manural contamination of milk is indicated by the anaerobic spore bacteria, producing gas. Routine examinations for gas forming bacteria are generally considered a good index of the past history of the milk sample. The unclean practice known as "wet milking," and the manural contamination of milk in numerous ways, makes the statement possible that a bacterial test sensitive to filth contamination equal to a teaspoonful of manure to a 10-gallon can of milk, which would easily be considered excessively contaminated, would bar from 20 to 25 per cent of all market milk.

A very excellent test of this character has been worked out by Dr. John Weinzirl of the University of Washington. It is known as the "Anaerobic spore test" and is directed against manural contamination. This test has a decided advantage over many other methods which aim at one thing or another, calculated to indicate purity or extent of contamination. The bacterial count might be very high in milk and still be of fair quality, free from filth contamination. It happens that the average bacterial content of the sewerage of 10 cities of the United States, was only half the bacterial count of the average for the market milk supplied to the city of Washington in the summer of 1906. The Weinzirl test is much superior to the visible dirt disc test, since that merely indicates the dirt that the dairyman's strainer allowed to slip through. Milk might be strained or clarified until a white disc is shown by the spores in the soluble portion of manure cannot be filtered out nor clarified by any means now known. As the Weinzirl test has the merit of simplicity, requires no special training for its mastery, and is applicable to all kinds of milk, there is no valid excuse for one failing to test milk for pollution, thereby going a long way toward bacterial control in the ice cream factory.

Here is a description of the test. "One-half to one cubic centimeters of melted paraffine is placed in a 15mm. test-tube which is plugged with cotton and sterilized either by dry or moist heat. By means of a sterile pipette, 5cc of the milk under test is placed in each of five tubes containing paraffine. The tubes containing the milk and paraffine are then placed in the Arnold sterilizer and heated to 80 degrees C for 10 to 15 minutes. This treatment melts the paraffine, which rises to the surface, where it hardens on cooling and forms the anaerobic seal. The heat also expels oxygen absorbed by the milk, thus rendering anaerobosis more complete. All the vegetative bacteria present in the milk are killed by the heat, only the spore forms remaining. The tubes are then incubated at blood heat. If anaerobes are present, gas will be formed, which lifts the paraffine plug in the tube. Two positive out of five tubes condemns the milk as showing excessive pollution.

Now, when we consider that the ripening of ice cream mix is caused by bacteria and we have so many present in our milk supply which tend to create off flavors, it becomes a problem as to the best method of accomplishing the purpose. Mix improvers gain time and create a proper condition for freezing by stepping in ahead of the result of bacterial activity. A pure lactic culture, introduced after pasteurizing, and holding the mix at about 55 degrees until the acidity reaches 0.25 per cent makes a very nice mix and inexpensive. Edible acids may be introduced directly into the mix up to a total acidity of 0.3 per cent for immediate freezing after pasteurizing and homogenizing and where it may be desired to store the mix in a cold room at say 40 degrees or lower, this per cent of acidity directly introduced retards the development of undesirable bacteria, to some extent, for a short time.

When a substance is pasteurized, all active bacteria are killed but their spores are not, as has already been shown.

The hay Bacillus is one of the chief offenders in milk. This is a spore former and the spores will survive pasteurization. The spores will germinate, after pasteurization, decomposing proteins of the milk, under aerobic conditions, frequently without the development of disagreeable odors which makes it very undesirable, for the milk or mix may be partly decomposed without its being suspected. A companion of the hay bacillus is the root bacillus, the one usually producing the odors, and digesting the casein in milk. There are, of course, many more having similar characteristics but the above named, together with one more usually found on potatoes, constitute the most important group of decay producing organisms.

In closing allow me to call attention to the fact that cleanliness is indeed next to godliness, as well as profit, in ice cream factory management, and that the wise and plentiful use of our old friend Wyandotte, associated with plenty of head work, water and steam will prevent many losses and heartaches. A plant does not have to be white and shiney to produce the best sanitary effect and low count of undesirable bacteria in the finished product.

You, who have *not* been buying from Mathews—what is your reason?

Have you, on seeing the beauty and richness of our Ice Cream advertising material, jumped at the conclusion that it must be too costly for you to afford?

You would be surprised to learn that some of the hangers you have admired so much can be had for as little as 15 cents in small lots, and less in larger lots. Large quantity output and efficient production in our own plant (which has been running both day and night the past three years) keep costs down.

Have you supposed that because we serve the largest Ice Cream Companies in America, we do not solicit small accounts?

That some have thought so, we know from their first letters to us. It's a big mistake. We have hundreds of small accounts (1409 accounts in all, the day this was written) and we care so much for them that they get exactly the same painstaking attention in every little detail, that we give to the "big fellows." Try us and *see* how much we care for your business. Most of our small accounts have a way of growing larger.

And any other surmise that may have kept you from having the benefit of Mathews Service, is bound to be just as far from the truth. There is one easy and sure way to find out—*investigate.*

We believe that a food so delicious, useful and refreshing as Ice Cream is worthy of all the expert thought, artistic talent and business energy that can be devoted to increasing its sale. That is why Mathews Ice Cream Advertising Material stands *first* in every respect—and why you see it in every part of the United States and Canada.

Don't guess—*Ask* us about it.

LOOK FOR HUDSON'S!

Herewith illustration of Exhibit at Buffalo, last year, of the Hudson Mfg. Company, Chicago. At Cleveland, October 16-21, Ice Cream Week—The Association of Ice Cream Supply Men's Exhibition and the Annual Convention, National Association of Ice Cream Manufacturers,—Hudson will occupy Booths Nos. 131-132 with an attractive exhibit. Here you will receive that hearty,

cordial welcome—so characteristically Hudson. "Sally," "Gabe," "Chris," "Bulger," "Rector"—in fact, the whole Hudson family will be there to greet you. At every Supply Men's Exhibition and National Dairy Show, Hudson has been there with their comfortable, cheery exhibits, ready to extend the hand of good fellowship, and eager to make "the boys" feel at home. Hudson Exhibits are always popular. Meet the Hudson family at the Dairy Exhibition, Twin Cities, and at Cleveland. They will have exhibits at both places.

SCHOOL OF REFRIGERATION ENGINEERING.

The fall term of the Three Months' Course in Refrigeration Engineering at the Siebel Institute of Technology, Chicago, will start September 12, 1922. This course, which was temporarily suspended during the war, has been greatly augmented and is proving even more popular than in former years. The Siebel Institute is the only school in the United States that offers to those interested in the subject of Refrigeration Engineering an opportunity to obtain a thorough scientific training in so short a period of time. All of the numerous other studies taught by state universities and colleges, requiring two to four years to complete, have been eliminated and only the most essential subjects are given. In addition, the classes are limited in number, which makes it possible for the instructors to give individual attention to each class member.

For the benefit of our readers who may be interested in such a course of training, it is suggested that they write to the Siebel Institute for full particulars as to the September class.

We use one quart of water to each pound of gelatine, let it set until it congeals, then heat to one hundred and fifty, (150) degrees, then pour it into the mix. We have found this to be the best method of dissolving the gelatine, for if we mix it direct with the mix, or with cold water, there will be lumps in it.—Contributed.

Mr. F. M. Hosler *Says:*

"I use gelatine in my ice cream because it makes it more palatable, and it adds to the food value. It makes the ice cream easier to digest, and I have used "SX" Gelatine for years, because I have found that it never varies in strength. Its high quality does not change."

Mr. Hosler is President of the Hosler Ice Cream Company, Albany, N. Y. His product has a splendid reputation. He has made a success of his business. The "SX" brand of Gelatine carries its own standard of quality and purity. It is the result of twenty years of manufacturing experience. A shipment to you today will prove why it is used by leading ice cream manufacturers.

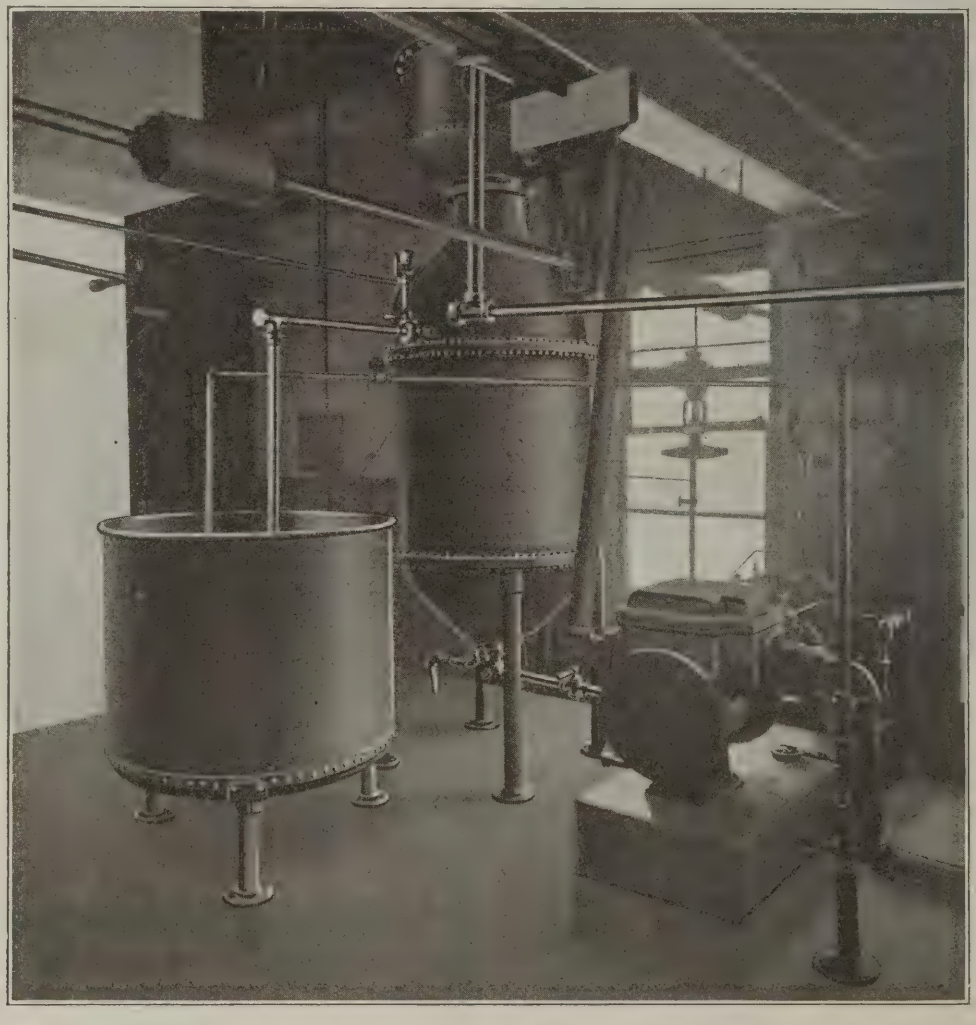
THE CONDENSATION PROCESS OF PREPARING AN ICE CREAM MIX.[1]

By R. W. Peterson and P. H. Tracy, Department of Dairy Husbandry, University of Illinois, Urbana, Ill.

THE general lack of uniformity in the use of materials and the methods of manufacture is responsible for the great variation in the standards and quality of ice cream found on the market. In the present method of manufacture of commercial ice cream, whole milk, sweet cream, plain (superheated) condensed milk, sugar, gelatine, and the desired flavoring usually form the ingredients. Evaporated milk, sweetened skim condensed milk, or milk powder and butter may be substituted for the above lacteal materials. A balanced supply of the different ingredients must be kept on hand at all times, and mixed together as needed. The mix is standardized to conform to a state requirement or a desired composition. In some cases the cream or the entire mix is pasteurized; and in a few plants the mix is homogenized. This must be followed by aging to insure the desired yield.



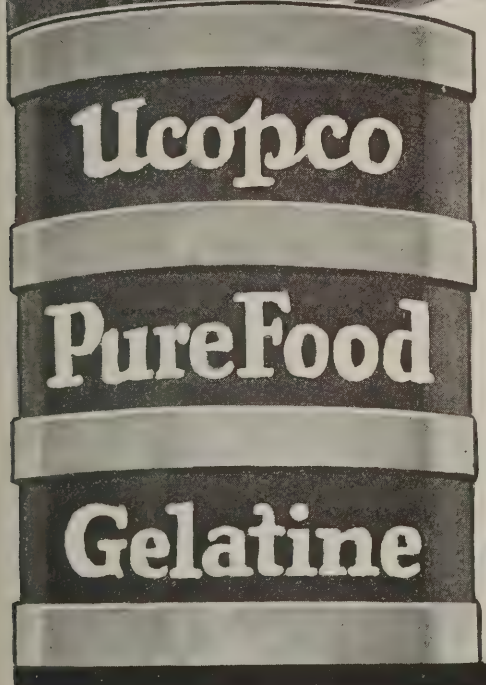
Within the last year the use of the condensation process of preparing an ice cream mix has greatly increased. This method consists essentially of combining sugar and the different lacteal substances in the proper proportions, evaporating to the desired composition, homogenizing, and cooling. The main purpose is to utilize merely milk and butter as the basis of the milk solids and butterfat. In the present methods of manufacture, however, it is impossible to use only milk and butter because the content of milk-solids-not-fat would be insufficient.

This paper is the report of a study which was made of the methods of preparation and standardization, and the bacteriological factors concerned in the condensation process. Part I deals with the preparation, and Part II takes up a study of the bacteria in the condensed mix.

I. Preparation of the Condensed Mix.

Apparatus Required.

In the preparation of the condensed mix the essential equipment is some form of concentrating apparatus. The ordinary "vacuum condensing pan" is the most efficient for this purpose. This consists of a copper retort with a steam-jacketed bottom, steam coils inside, and some form of condenser. A large, steam-driven, vacuum pump makes possible the evaporation of water under reduced pressure, at a temperature of about 130 degrees F., thus promoting rapidity and economy of evaporation.



Mojonnier 3-ft. Vacuum Condensing Unit in Plant of Evansville, (Ind.) Pure Milk Co.

The ingredients are mixed in a large open kettle, commonly known as the "forewarmer." Any vat could be utilized for the purpose. Heat may be applied by means of coils, or by introducing live steam directly into the mixture. While the latter method introduces some water, it is more rapid and serves to agitate the milk while being heated.

A Baume hydrometer, or a Westphal balance, may be used to indicate the point of proper concentration.

[1]This work was carried on under the supervision of Dr. M. J. Prucha and Dr. O. R. Overman, and with the co-operation of Dr. H. A. Ruehe, Dairy Department, University of Illinois, Urbana, Illinois.

IT'S OUR COUNTRY; LET'S WORK FOR IT—LET ADVERTISERS HELP YOU.

Either a homogenizer or a viscolizer must be utilized in order to thoroughly emulsify the fat in the mix. This prevents the rise of butterfat during storage, and increases the viscosity of the mix. An efficient means of cooling must be provided. The ordinary upright open-faced cooler answers the purpose. This type of cooler also permits the drawing off of the mix directly into clean, dry cans. The mix may be pumped into large, insulated storage tanks and held until needed.

Materials Used.

Fresh whole milk is the best and cheapest source of the milk-solids-not-fat. This provides a clean, fresh-milk flavor which is not destroyed in the process. Economy is obtained by contracting for milk directly from the producers. Even if milk is purchased from distributors, it is still the cheapest source of milk solids. Skim milk may be used to advantage, especially if an outlet for the sweet cream is available.

Unsalted butter is necessary to add to the mix in order to supply the proper amount of butterfat. Sweet cream may be used, but the use of it tends to increase the cost of the mix, unless there is no other outlet for the sweet cream. If sweet cream is used, advantage is taken of the solids-not-fat in the cream in the process of standardizing.

Either cane or beet sugar may be used for sweetening.

Process of Manufacture.

General Procedure. 1. Examine the milk to make sure that it is fresh, clean, and sweet. Test a representative sample of the milk and of the cream (if cream is to be used) for percentage of butterfat and total solids, calculating the solids-not-fat by difference. The percentage of butterfat in the butter should also be determined.

2. Calculate the quantity of each ingredient to use:

a. It is necessary to first decide upon the percentage composition desired in the finished mix. Butterfat, milk-solids-not-fat, sugar, gelatine, and total solids must be taken into consideration.

b. Such amounts of the different ingredients are used as will give the desired proportion of butterfat, milk-solids-not-fat, sugar, and gelatine in the finished mix. No further standardizing will then be required unless the batch is overcondensed, in which case pure water only is needed.

c. When a definite quantity of mix is desired, the amount of milk required is ascertained by multiplying the percentage of milk-solids-not-fat in the mix by the pounds of mix, and dividing by the percentage of solids-not-fat in the milk. The amount of butter required is found by multiplying the percentage of fat in the mix by the pounds of mix desired, subtracting the product of the percentage of fat in the milk, times the pounds of milk, and dividing by the percentage of fat in the butter.

d. When a given quantity of milk is used, the yield of mix is found by multiplying the percentage of solids-not-fat in the milk by the pounds of milk, and dividing by the percentage of milk-solids-not-fat in the desired mix. The butter is then calculated as in (**c**) above.

e. If cream is used, the ratio method of standardizing may be conveniently applied, advantage being taken of the solids-not-fat in the cream. Special tables have been prepared for a mix of a definite composition, which greatly simplify these calculations.

3. Weigh, or carefully measure, the required quantities of each ingredient into the forewarmer. The gelatine is added after condensing, either before homogenizing, or before freezing.

4. Heat the mixture in the forewarmer to 160-170 degrees F. This pasteurizes the mix, facilitates the melting of the butter and the solution of the sugar, and increases the rapidity of evaporation in the condensing apparatus.

5. Remove the excess water by evaporating under a vacuum of about 24 inches, at a temperature of 130 degrees F. The batch is "struck" when the proper reading is obtained on the Baume hydrometer, or Westphal balance.

6. Transfer the condensed mix to a vat with an efficient agitator. If this vat is mounted on scales, the mix may be weighed. Otherwise the full yield is obtained by measuring the volume and adding the necessary water to secure the proper yield.

7. Homogenize or viscolize the warm condensed mix, under a pressure of about 2000 pounds per square inch.

8. Cool the mix as rapidly as possible to a low temperature, preferably from 40 to 45 degrees F.

9. Store the prepared mix at as low a temperature as possible, without freezing.

10. Retest the finished condensed mix, and restandardize if necessary.

Composition of a Representative Mix Before and After Condensing (100 Gallons).

DETROIT CLEVELAND

Cherry-Bassett-Winner Company

BALTIMORE PHILADELPHIA PITTSBURG

The ingredients named under "materials" are placed in the forewarmer, resulting in a mixture having the composition shown in the second column. The excess water (510.5 pounds) is removed by condensing. When the desired composition is reached, the Baume reading will be 10.3 degrees at a temperature of 130 degrees F. The final test is shown in the third column.

The mixture may be condensed slightly heavier than necessary, and made up to exactly 100 gallons by adding pure water. With the addition of flavoring, and gelatine if it has not been added previously, the mix is ready for freezing at any time.

Conclusions.

1. A uniformly prepared ice cream mix may be made by the condensation process, using milk, butter or cream, sugar and gelatine.

2. The condensed mix is easily standardized to a uniform composition by having the butterfat, milk-solids-not-fat, sugar and gelatine in the proper proportion before condensing. A definite yield is thus obtained.

II. A Bacteriological Study of the Condensation Process.

Since bacteria in ice cream are of importance from a sanitary as well as an economic point of view, a bacteriological study was made of the mix prepared by the condensation process.

Counts were made by the plate method, using standard lactose agar as media. An incubation period of four days at 30 degrees C. was used. In all cases the counts given are the averages of the two plates made for each sample.

Source of Bacteria.

The lacteal substances used are the chief source of bacteria in the ice cream mix. Since milk and cream are ideal media for the growth and development of bacteria, it is to be expected that such products will greatly increase the bacterial count of the finished product. The sugar and gelatine are usually of minor importance, but utensils are a very prolific source of contamination.

The number of bacteria in the mix will vary according to the care that the milk products have received prior to their use, and according to the plant procedure. At the Iowa Experiment Station the number of bacteria in thirteen samples of ice cream was found to range from 130,000 to 40,850,000 per cubic centimeter (1). The United States Department of Agriculture found the average number of bacteria in 94 samples to be 37,859,907 per cubic centimeter. The maximum was 510,000,000, and the minimum 120,000 (2). The extremely high counts in ice cream are no doubt due to the fact that many manufacturers do not pasteurize their mix, nor take the proper precautions to avoid recontamination.

Efficiency of Pasteurization of the Condensing Process.

In order that ice cream may be a safe product for human consumption, and in order that the danger of souring may be reduced to a minimum, the mix should be subjected to some form of pasteurization. In the condensing process the mix is heated to 160-170 degrees F., in the forewarmer, and then condensed at a temperature around 130 degrees F. The efficiency of pasteurization of this process is shown by the following tabulation:

Batch No.	Mix Before Heating in Forewarmer	Direct From Pan Actual Count	Direct From Pan Comparative Count*	Destruction Per Cent
1	9,600,000	800	480	99.98
2	2,260,000	20,000	12,000	99.47
3	21,600,000	2,400	1,440	99.96
4	7,600,000	7,200	4,320	99.94
5	51,000,000	27,200	16,320	99.97
6	12,250,000	3,560	2,136	99.98
7	3,660,000	3,750	2,250	99.94

* The comparative count represents the number of bacteria per cubic centimeter that would be in the mix if the original volume had been retained, allowance being made for the decrease in volume, due to condensing. It is obtained by multiplying the actual count by 0.6.

These data show the completeness of pasteurization brought about by the heat in the forewarmer and condenser. In most cases the count of the condensed mix was quite low, the minimum being 800 and the maximum 27,200. Five of the seven batches run had a count of less than 7,500 per cubic centimeter.

The tendency of the unpasteurized mix to have extremely high counts is indicated by the number of bacteria per cubic centimeter found before heating it in the forewarmer. If ice cream is to be safely and economically produced, the mix must be subjected to some process that will greatly decrease the bacteria.

Number of Bacteria at Different Stages of Manufacture.

To determine the relative importance of each step in the manufacture of the mix, counts were made of two batches after the completion of each step in the process. Care was taken to clean each utensil before it was used, by rinsing it with scalding water.

Before Heating in Forewarmer	Direct From Pan	Direct From Homogenizer	After Addition of Gelatine	Frozen Ice Cream
9,600,000	800	1,400	1,450	2,600
2,260,000	20,000	26,200	26,250	31,000

These results indicate that after the mix is drawn from the pan the subsequent steps in the operation will result in the addition of only a very small number of bacteria if ordinary precautions are taken against recontamination. The increase after homogenizing and freezing is probably due, for the most part, to the breaking up of the bacterial clusters, which results in a higher count by the plate method.

The number of bacteria added by the gelatine will depend upon the grade of gelatine and the temperature

to which it is heated. The temperature used in this experiment was 160 degrees F., which was sufficient to kill most of the bacteria without injuring the jelling qualities of the gelatine. It may therefore be seen that with proper care there will be only a slight increase in the bacteria in the frozen ice cream over the number in the mix as it comes from the pan.

Keeping Qualities of the Mix.

It often becomes necessary to store either the milk products or the mix for several days before freezing. It was found that condensed mix could be kept in a very good condition at a temperature of 32-35 degrees F. for a period of two weeks. Some was kept a month and then frozen into ice cream which contained no noticeable off-flavors.

Mix Stored in 10-Gallon Can at 32-35 Degrees F.

Days	Bacteria Per Cubic Centimeter	Condition
0	1,400	Very good
5	1,700	Very good
14	762,000	Good
23	42,210,000	Fair
32	188,500,000	Fair (frozen into ice cream)

As might be expected from the bacterial count, very little difference could be detected in the taste of the mix during the first two weeks of storage. It was not until the third week that a slight off-flavor began to develop. Thirty-two days after it was put into storage, the mix was frozen into ice cream, and although it contained large numbers of bacteria, no off-flavor could be detected in the finished product. If the condensed mix is properly made and handled, the ice cream manufacturer should have no trouble in storing it for two weeks at a temperature of about 32 degrees F.

DETROIT MICH.

Conclusions.

1. From this experiment it may be concluded that it is possible to prepare an ice cream mix by the condensation process that contains a very small number of bacteria.

2. The number of bacteria in the mix as it comes from the pan approximately represents the number that will be in the frozen product, providing ordinary care is taken.

3. The mix will keep for two or three weeks when stored at a temperature of 32-35 degrees F.

DAIRY BOOSTERS FETED IN TWIN CITIES.

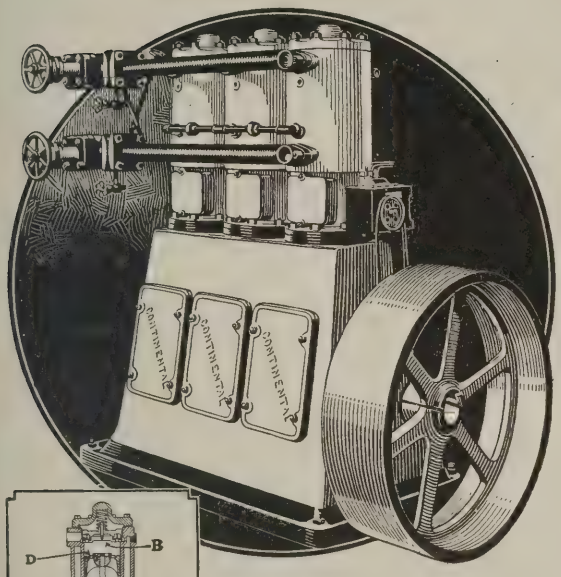
Dairy farming in the Northwest not only means the elevation of farms to newer planes of prosperity, but is a force that will create wider markets for manufactured goods, and develop new lines of progress for business of every character.

This was the message given to advertising directors of the leading manufacturing, wholesale and retail firms of Minneapolis and St. Paul on August 5th by a quartette described in The Minneapolis Tribune as "four of the country's leading apostles of dairying."

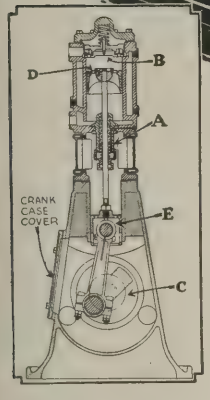
Attending as guests of F. E. Murphy, publisher of The Minneapolis Tribune, at a luncheon in Minneapolis, sixty advertising men heard G. L. Busian, advertising manager of the DeLaval Separator Company; N. C. Tompkins, advertising manager of the Creamery Package Manufacturing Company and R. C. Chase, publisher of The Dairy World, all of Chicago, who constitute the Publicity Committee of the National Dairy Association. Other speakers were Col. W. E. Skinner, General Manager of the National Dairy Exposition to be held at the Twin Cities, October 7-14, and E. C. Hillweg, assistant publisher of the Minneapolis Tribune.

Later at a dinner given by the Towncriers' Club of St. Paul at the St. Paul Athletic Club, the speakers were Messrs. Busian, Tompkins and Chase, W. A. Gordon, editor of The Dairy Record and J. M. Hannaford, Jr., chairman of the St. Paul committee on promotion of the Exposition.

Advertising men of the Twin Cities, it was declared, can do no greater thing for their respective businesses than to promote the dairy movement and thereby put money into farmers' pockets.



At the noon meeting Mr. Hillweg warned Northwest men not to consider all their problems solved with the marketing of a single good grain crop in 1922. "We all have waited five years for this crop—let us not wait five years for another one but insure a steady income from all kinds of farm products each year," he said.



Members of the National Publicity Committee were the guests one afternoon of Colonel Skinner and Edward Barr, director of publicity and promotion, on an automobile trip from St. Paul to Chisago City, Taylors Falls and Marine Mills.

A NEW CONE.

Something new in the confection line has been discovered by L. E. Fickel and Dr. R. S. Graves, both of Columbus, Ohio. It is an ice cream cone, constructed out of solid chocolate. The cone may be filled at soda fountains just like the ordinary cone, and have the advantage of combining ice cream and chocolate candy. The inventors claim that their cone can be filled with other things than ice cream, such as whipped cream whipped cream and fruits.

CONTINENTAL

A—Continental Stuffing Box with patented spring tension — correct design and length, a prime factor in securing intensive ammonia control. It prevents ammonia from entering the crank case.

B—Minimum clearance constantly maintained to keep compressor at fullest efficiency during entire life of machine.

C—Accessible crank case—adjustments quickly, easily made, without danger of ammonia because no ammonia can enter a Continental crank case.

D—Continental Vanadium Steel ribbon suction valve — no springs to clog with oil, retard valve action, or cause other trouble. Automatically adjusts itself to any speed at which machine operates—a feature that guarantees a wide range of speeds and capacity with perfect safety.

E—The Continental Cross Head confines the piston travel to a precise vertical movement thereby preventing side thrust of piston on cylinder wall. A Continental cylinder cannot wear oval thereby preventing gas leakage past piston. The adjustment of piston rod in cross head permits minimum clearance between piston head and discharge valve seat to be maintained at all times which means continuous maximum efficiency.

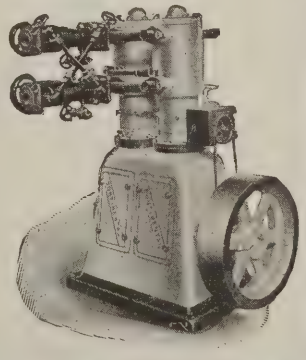
Co-operative Service

Our Service Bureau and Refrigerating Engineers will gladly study your particular problem and offer recommendations for your consideration without any obligation whatever. This department is maintained to co-operate with our customers and as an authoritative source of practical, helpful information for those interested in efficient refrigerating equipment. Put your problem up to us; if you like we'll send you a data sheet for this purpose.

Greater Economy

Now Possible in

REFRIGERATION



and Ice Cream Making

—by means of the CONTINENTAL which cuts power and operating cost, occupies a minimum of space and lasts longer because of perfect balance and absence of vibration as well as a better than ordinary construction. A big step forward.

You are sure of absolute ammonia and temperature controls by the use of a CONTINENTAL Compressor. The CONTINENTAL stands alone in this respect and every user has a big advantage over old methods of ice cream production. No ammonia in crank case. No oil contamination in cooling coils.

Please remember also that when you add a CONTINENTAL Ice Cream Freezer to your equipment, you have an asset in your business which will make a big increase in your ice cream production. Operates quicker. Lasts a lifetime — saves power — saves time — *saves* money — *makes* money — speeds business. *Let us prove it to you.* You will profit.

Standardization of Equipment

Chairman's Report of "Standardization of Equipment" Committee of the International Milk Dealers Association

THE history of the STANDARDIZATION COMMITTEE dates back to October, 1920, when it was suggested by Mr. Flood, of Spokane, Washington, that there were various types of equipment which dairymen used, which could be standardized, or at least simplified. Accordingly, at the October Convention in 1920, a committee was formed, known as the "STANDARDIZATION OF EQUIPMENT COMMITTEE." This Committee at once began the study of dairy equipment which might be standardized or simplified. The equipment which was considered most in need of standardization, was, sanitary pipe and fittings, cans, bottles, cases, and milk wagons. The work of this Committee from October 1920 to October 1921, was confined to a review of the field of labor, and the finding out by means of questionnaires, which, accompanied by letters, were sent out through the Secretary's office, to all members of the International Milk Dealers Association, for the purpose of finding out direct from the members, what equipment they considered most in need of standardization. Ninety per cent of our members requested that sanitary pipe and fittings be first dealt with. The Committee then consulted with the manufacturers of sanitary pipe and fittings, as to the possibility of standardizing this type of equipment. The manufacturers advised our Committee that they realized it was a desirable change, but that they would not care to make any change except on a crystalized demand from the dealers themselves. The work thus far, was reported at the Convention in October 1921.

With this information before the present Committee, they decided that this year's work from October 1921 to October 1922, should be an endeavor to evolve a standard sanitary fitting. As a guide, we requested the experience of our members through a questionnaire, as to the type of fitting they had found most serviceable. The great bulk of the replies had found Acme or Square thread fittings, and O. D. pipe, to have given the best satisfaction and best wear.

With this information before our Committee, we called a joint committee meeting of the National Ice Cream Manufacturers Association, National Butter Manufacturers Association, together with our Committee, to confer with the machinery manufacturers, to consider the matter, and see if the manufacturers would be willing to change their patterns, and make a new standard fitting.

I should have explained that prior to this meeting, the International Milk Dealers Association had communicated with the Butter Manufacturers Association, and the National Ice-Cream Manufacturers Association, as to their view on standardization of dairy equipment. They had both approved of it, and both of these Associations had appointed committees to go into the question of Standardization of Equipment with our Committee, and all of these Associations jointly discussed the question of standardization of sanitary fittings with the machinery manufacturers.

At this meeting, the whole question of Standardization of Equipment was thoroughly discussed. The difficulties were fully considered, and we realized that it would mean a big sacrifice to many of the manufacturers, to change their patterns and machinery, to manufacture a standard sanitary fitting. We also realized that these manufacturers would have to carry some of the old fittings, to take care of repairs in plants which were equipped with their original fitting, and who might not wish to immediately adopt the new standard fitting, but it was felt that at the end of probably five (5) years, that most of the old fittings would become more or less obsolete, and that at the end of that period, they would be able to discontinue altogether, the manufacture of any fitting, except the standard fitting. In the meantime, all new machinery would be equipped with the standard fitting, by practically every firm in the country, and no matter whose machine you bought, a dairy machinery user could go to his nearest dairy supply house, and get standard sanitary fittings to fit his new machine, without sending across the continent to the original manufacturer of his machine, to get some particular fitting.

The manufacturers present at this conference, unanimously agreed to make whatever standard fitting our Committee decided upon.

We then called into conference, the engineers of most of the largest manufacturers, with the idea of designing the best possible sanitary fitting, scientifically proportioned, which could be drafted from the combined knowledge of all the firms represented. These engineers have now nearly completed their work, and we expect to have the specifications of the new fitting ready shortly, and the International Milk Dealers Association, the Ice Cream Manufacturers Association, and the Butter Manufacturers Association, will bring before their Conventions this fall, a report, recommending a standard fitting, and they expect to have samples made by different firms, to show that this fitting is interchangeable. It will then be up to the memberships of the various

De Raef Weight Standardizer

Registered U. S. Patent Office

PHONE MAIN 2720

Purity Ice Cream Co. Ltd.

St. John, N.B. ---- 192-

N. A. Kennedy Supply Company,

Kansas City, Mo.

Gentlemen:

This is to certify that we have one of your De-Raef Standardizers in use, and find this machine perfectly satisfactory in every way. Although we have not been using any other make of machine of this type, we have seen a number of other makes in use in other plants. We believe that your machine is far ahead of anything in the work that it does, standardizing by weight instead of overrun, and would be glad to cheerfully recommend your machine to any other ice cream manufacturer.

We might mention in passing that we paid a duty of thirty-five percent on this machine, which is the regular duty on machines of this type coming into Canada and we feel that we have been more than repaid for this extra expenditure.

Mr. De-Raef's stay with us has been a most pleasant one as well as instructive to us, inasmuch as the reports and checking systems which he has adopted are invaluable.

It is our intention to open up two new freezing stations this fall or winter, and you can rest assured that one of the primary installations in these plants will be the De-Raef Standardizer.

Very truly yours,

PURITY ICE CREAM CO. LTD.

A. L. Stone Mgr.

"The Cream of Quality"

National Distributor

N. A. KENNEDY SUPPLY CO.

KANSAS CITY - MISSOURI

organizations to adopt or reject this fitting, as they see fit.

If it is adopted by the memberships of these various organizations, then the manufacturers of dairy machinery and sanitary pipe and fittings are willing to manufacture it and equip all new machines with it. Then it will also be up to the members of these organizations to be true to their convictions, and buy the new standard fitting for all new machinery, and as far as possible, to use them for all renewals and repairs.

We realize that it means a complete revolution for many plants, who are not using the same size pipe and the same type of thread, as the standard pipe and fitting would be, but this fitting has been designed to suit the needs of seventy-five per cent (75%) of our membership, and if we hope to accomplish standardization of sanitary fittings, we must be prepared to put up with a little confusion for a short time, until all of our fittings that are not standard, are obsolete. In five (5) years' time, we feel that most of the old sanitary pipe and fittings will be out of use, and that the new standard sanitary fittings will be used all over the United States and Canada, and that they will be procurable from your local dairy supply house. For repairs and extensions, adapters will be furnished, so that you can fit the new O. D. standard fittings to your old I. D. pipe. Thus it will not be necessary to immediately scrap your old equipment, as you can do this by easy stages from time to time, as you remodel your plant or put in new machinery.

With the growth of the dairy business, and the increased use of sanitary pipe and fittings in most of the creameries, and smaller plants of the country, it would seem folly to continue to manufacture a dozen different types of sanitary fittings. One member reported that he had seven (7) different types in his factory. The great majority of the larger firms have at least three (3), and with these conditions before us, it is evident that it is time to stop and consider the welfare of the future dairymen of this country, and it seems up to us at this time, to simplify and standardize sanitary pipe and fittings, and make them as simple to procure and use, as standard iron pipe and fittings are today.

The Committee felt that if they undertook this one thing as their year's work, and accomplished what they aimed at, that they had done a splendid service for the dairy interests of North America, the benefit of which, would be very difficult to measure in dollars and cents, as we confidently believe it will eventually result in great economy.

We want all our members to fully consider and weigh this matter, so that when they come to their Convention this fall, they will be fully prepared to discuss this matter intelligently, and to give a final decision. If the decision is for a standardized fitting, then stick to the decision of the Convention, and buy nothing for new equipment other than **Standardized Fittings,** irrespective of the fact that your plant may be equipped with some other type. If this fitting is adopted, a start will have to be made sometime, so "LET US DO IT NOW."

If a standard fitting is adopted, we will confer with the manufacturers as to a date when this fitting will be available, so that we may know when to expect it on the market, and govern our purchases accordingly.

The question of standardization of cans, bottles, cases, wagons, etc., will not be dealt with, until sanitary fittings are disposed of. Possibly time may be found on the Convention program, to discuss them briefly, after the question of fittings has received your attention.

W. H. FORSTER,
Chairman of the Committee on
"STANDARDIZATION OF EQUIPMENT."

DAIRY COURSES AT AMES.

Those who are contemplating entering some dairy school should begin to make definite plans as it will soon be time when the various dairy schools will open. The Dairy Department of Iowa State College is offering two dairy courses, beginning September 25th, a four year course and a six months course.

The four year course is open to graduates of high schools who present the proper amount of work. Persons completing this course receive the degree of Bachelor of Science.

The training acquired in the six months course, together with practical experience, enables the students to fit themselves to manage and operate dairy establishments. Butter, ice cream and market milk plants all draw upon the six months course for men. A student entering the six months course must be at least seventeen years of age, and must have satisfactorily completed the eighth grade of the public schools or its equivalent.

The ten day course for experienced creamery operators will be offered in February.

For further information address Dairy Department, Iowa State College, Ames, Iowa.

"What are you cutting out of the paper?"

"What are you going to do with it?"

"Put it in my pocket."—Laughing Gas.

DUNN'S CELEBRATED
Ice Cream Gelatines

GUARANTEED TO COMPLY WITH ALL STATE AND FEDERAL FOOD LAWS

IN 1883 the great advantages of Gelatine in the production of Ice Cream were apparent to us and we personally demonstrated these facts to the manufacturers at that time.

Today it is a pleasure to realize that many millions of pounds of Gelatine are being used annually in the Ice Cream industry as a result of the introductory work done by this company.

Because of our long and close affiliation with the Ice Cream industry we feel we are best qualified to supply Ice Cream Gelatine of standard uniform quality, which gives the best results *economically*.

Nutting

Ice Cream Can Truck

Durable!

THIS rugged ice cream can truck will give you **years of service.** The frame is built like a steel bridge, of structural angle steel, strongly riveted and specially braced at the corners to withstand shocks. And it is rust-proof—entirely galvanized.

Easy Rolling. Ball bearing, swivel casters. Main wheels 8¼ inches high, with wide, smoothly machined flat face to save floors. Cold rolled steel axle, heavy axle boxes and collars.

The top can't sag. Rail around top, optional, holds all covers and keeps them with cans. Four wooden bars at the bottom fully protect cans from denting.

Keep your cans on wheels with these strong, light-running, durable Nutting Trucks. You can now buy them at the following

MORE INFORMATION ON ICE CREAM STANDARDS.

In an article in the August issue of The Ice Cream Review, a reference to the Georgia milk fat standards stated that the sale of homogenized milk products in the state of Georgia would not be permitted, but in a recent letter from the Georgia State Dairy Inspector, he says, "We still have the rules, or rather regulations, in regard to ice cream made out of homogenized products, but, as I interpret the law, this refers to homogenized frozen milk products which carry less than eight per cent of butterfat."

In the state of Massachusettes, there are no regulations for ice cream except a seven per cent butterfat standard for all ice creams and that clean, matured, and non-rancid nuts and fruit should be used.

MISSISSIPPI ICE CREAM MANUFACTURERS' ASSOCIATION WINS VICTORY.

Meridian, Miss., Aug. 15, 1922.

Editor: Ice Cream Review:

It is with pleasure that I advise you that under date of August 3rd the Mississippi Railroad Commission issued an order denying the application of the express companies for placing into effect the increased billing weights on shipments of ice cream intra-state.

The Mississippi Association has consistently opposed the increased billing weights since the first application of the express companies which went into effect on interstate shipments February 4, 1921. The Mississippi Commission held in suspension the weights Measure until a hearing was held on July 24, 1922, when a committee of W. D. Seale, Chas. McNair, V. N. Vail, S. N. Sutton, N. D. Brookshire, C. W. Hayward, Attorney, appeared in behalf of the ice cream manufacturers of this state, placing before the Commission evidence showing the injustice and many discriminating features in connection with the application of the express companies, with the result that the Commission decided as noted above.

Thanks to the National Association which assisted us very materially by supplying data which was of much value.

Very truly yours,
N. D. BROOKSHIRE,
Secretary-Treasurer.

McWHORTERS' BUY ICE CREAM PLANT OF PURITY FIRM.

A business deal was consummated a few days ago whereby the McWhorter Ice Cream Company at 430 North Stone Avenue purchased the entire ice cream equipment of the Tucson Purity Ice Cream Company in the Heidel Hotel building, Tucson, Ariz.

The McWhorter brothers, who hail from Bisbee, where they have been in the same business for the past ten years, come from a family who have spent their lives in the ice cream and candy manufacturing business and are considered experts in their line.

Aside from the equipment purchased from the Purity Company, they have a complete equipment at their plant on North Stone Avenue, where construction engineers of the Davis-Watkins Dairymen's Manufacturing Company of Los Angeles are installing one of the finest refrigerating rooms in the state, in which the temperature can be lowered to 15 degrees below zero.

The new factory, when completed, will be the finest ice cream factory in the state of Arizona.

ESKIMOS A LA MODE.

The adventures of Cook, Peary and other Arctic explorers, had absolutely nothing on the frigid experiences of three men who were visiting the Mount Union ice cream plant of the Pure Milk Products Company, Mount Union, Pa. These three men were J. E. Braun of Granville, Pa., Lloyd Vaughn and J. Sellers of Mount Union. The superintendent of the plant was showing them around the building, and took them into the hardening room, where the temperature was slightly below zero. "In this room," he was saying, "the ice cream is placed while in a semi-soft state, and after being in here for a certain period, is taken out, frozen perfectly solid." At this moment he was called to the office, and left his guests, expecting to be gone only a moment.

While the explorers were looking about with chattering teeth and shivering bodies, the heavy door swung shut, and a bolt dropped out of the automatic fastener. They screamed, pounded, and made every possible noise, but the 12-inch thickness of the walls deadened any sound they could make, and they had horrible visions of themselves being carried out eventually, 'frozen perfectly solid.' The superintendent was detained for about twenty minutes, and not until he returned were the prisoners rescued from their chilly predicament. All three are willing to go on record as stating that those were the longest twenty minutes they ever spent in their life, or ever hope to. It is hoped that they recovered from their experience without even a chilblain to remind them of their frigid adventure.

⚜

YAKIMA FOLK HEAVY CONSUMERS OF ICE CREAM.

Six hundred gallons of ice cream or enough to supply each Yakima man, woman and child with a large dish are sold by the Yakima creameries and confectionery stores on an average summer day, a survey shows. This would make about 30,000 ice cream ones.

On the average Sunday between 700 and 800 gallons of ice cream are sold or nearly enough to give every Yakima person two dishes. On a Sunday in real hot weather Yakimans consume about 1,000 gallons of ice cream. On the Fourth of July, always the biggest ice cream day of the year, approximately 3,000 gallons of ice cream were sold in Yakimo. This would make 150,000 ice cream cones or about 8 for each Yakima resident.

The brick ice cream trade is steady throughout the year, nearly as much being made in the winter as in the summer. The heavy trade in carton ice cream is on Saturday and Sunday. During the summer months the sale of cones has cut the sale of the ice cream bars considerably.

An ice cream maker at a creamery has to be a weather forcaster if he is to make the right amount of ice cream mix and have a sufficient supply of mix and ice cream on hand all of the time. A stretch of a few hot days will clean a creamery out of mix and ice cream and run the ice cream makers and drivers ragged, so they all begin to pray for cool weather. After it has been cool for a time and the men have caught up again they want warm weather. So goes the life of the ice cream maker through the hot summer months.—Yakima (Wash.) Republic.

⚜

People drink their coffee and tea just as hot in summer as they do in winter, and they can eat their ice cream just as cold in winter as they can in summer. Seasonal? Bosh!

Ice Cream Improvers — Do They Improve?

By W. P. ABEL Before Pacific Association of Ice Cream Manufacturers

IT HAS been my pleasure to be with you on various occasions. In fact, my visits have been so pleasant that I almost look forward to it as coming back home. The friends I hvae made and the receptions that have been extended and the entertainment that has been offered certainly do place me under obligations to all of you.

Now, that I have had the opportunity of presenting to you a short and brief paper on ice cream improvers, something I have been interested in for the past year, I will present it at this time.

Much has been written and said about the composition of the first ice cream mix. We are told that cream and a thickener, sugar and flavor were only use. Eggs were later introduced as a semi-stabilizer, and also to impart richness of flavor. Development of French custard ice cream with eggs in greater quantities followed soon thereafter. Special ice creams are still prepared with the aid of fresh eggs. As one of the very first improvers of an ice cream mix, gelatine stands out preeminently. It retards or prevents crystillization, and will always remain as an improver of ice cream.

The advent of commercial ice cream brought us improved factory conditions, perfect sanitation, better equipment, improved freezers, larger mix storage tanks, and more efficient hardening rooms. All of these are in the truest sense improvers of ice cream.

The progress of the ice cream industry was astonishing and attracted the masters of finance. The rapid strides made and the increased demand for that cooling and nourishing dish encouraged the employment of larger capital. Competition became keener and attention was then directed to the milk or serum mix. "It's all in the mix," became a slogan which awakened interest in the basic ingredients of an ice cream mix. Master minds soon directed attention to the solid content and suggestions were made that a more viscous and homogeneous mix would improve the texture and eating qualities of a resulting ice cream. Here the knowledge of experience was brought into a blend with theory and suggestions of practical value became a contribution towards real progress. Competition awakened more interest in quality. It was admitted that the quality of ice cream should be impressive. The flavor and texture should incite favorable comment on the part of the consumer.

A review of the improvement made since the time ice cream became a commercial product, leading up to conditions which encouraged the introduction of a soluble compound, to further improve and fortify the work of mechanical devices will be of interest. We will therefore ask, What are further Improvers of Ice Cream, and what Progress have they made?

Methods of compounding, appliances or added ingredients, which produce a better texture, and flavors also enhance the character of ice cream are improvers. Every machine in use today may be correctly termed an improver. The pasteurizer, emulser, homogenizer and viscolizer are mechanical devices now employed in the larger plants because of the efficient service they render.

The breaking up of the fat particles and distributing them throughout the mix is credited as being an improvement of great magnitude. This process also suggested a way whereby powdered milk and sweet butter with water or skimmed milk could be re-assembled into a cream emulsion. The resulting re-constituted cream became a splendid basis for an ice cream mix.

Pasteurization and passing the mix, under pressure, through a mechanical device are essential to produce good ice cream. I do not belittle or discredit these mechanical improvers or the processes involved. In fact the described method produces a very good commercial ice cream.

Further consideration, however, developed that a marked improvement might be worked out. It was found that milk and cream possess a slight amount of milk acid, which co-operate with the heat of pasteurization to render the casein hard, tending toward the insoluble. Homogenization gives the entire batch of milk compounds a severe breaking up. The threads, shreds, and filaments of casein are broken into tiny snips, scattered promiscuously and left unattached. Powdered improvers on sale that act upon these particles of milk solids, soften them and binds them into longer threads, thus producing a mix of dependable viscosity and consistency.

Aging of an ice cream mix in holding tanks and the addition of ripeners are also improvements over the quick mixing and immediate freezing methods.

Thus far I have directed your attention to mechanical improvers, methods that improve and added substances which soften the solids of milk.

The softened milk solids, the pasteurized mix, the homogeneous mass, as produced by mechanical devices, did in more or less degree impair or entirely cover up the cream flavor. Minds again became active, research unfaltering and untiring, developed a product in semi-paste form which made a further improvement in the

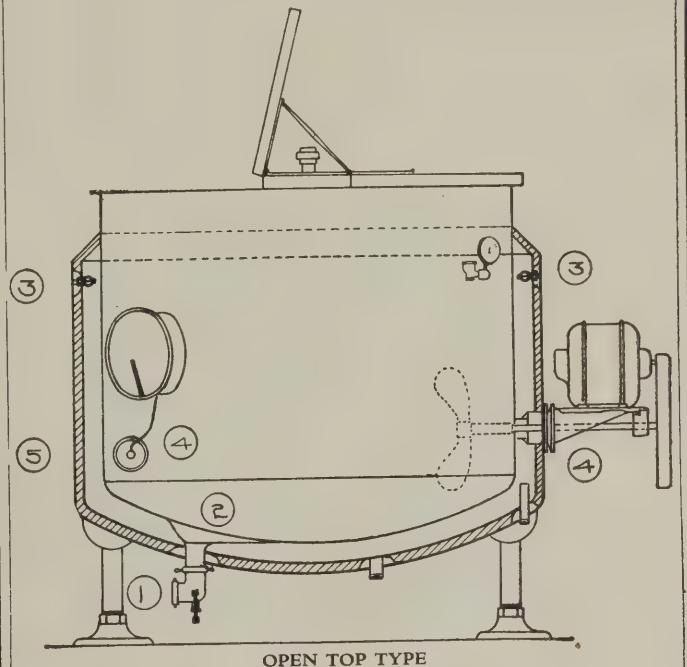
A New Model Ice Cream Pasteurizer

New Features

1. One of the important improvements in the new model pasteurizer is the **removable flush bottom outlet valve.** It has the following advantages:

(a) Removable from the outside.

(b) More easily cleaned.



(c) May be cleaned without entering tank.

(d) Pressure from the weight of the mix is exerted above valve, thus danger of moving valve from seat is eliminated.

2. **The bumped out construction** not only eliminates the long operating handle, but brings the valve and pipe connection to a more convenient position. This new construction drains perfectly and more rapidly, as it prevents swirling of the contents.

3. **The new inside spray coil,** designed so that the pasteurizer might be insulated, has the advantages listed at top of column at right.

Open or Closed Top in Sizes From 200 to 1000 Gallons

OPEN TOP TYPE

RECENT changes in design introduce the Elyria Pasteurizing Unit in a new light. The glass enamel and the sturdy steel body are of standard construction and call for no further explanation. Five important improvements in design are worthy of inspection. The Elyria Ice Cream Pasteurizer, which has been recognized as a big success for five years, has been raised to a still higher plane as a result of these improvements *which are all exclusive Elyria features.*

New Features

(a) Leaks cannot develop and stain tank.

(b) Water cannot get beneath the insulation.

(c) A true nozzle spray, not a jet with small holes.

(d) Easily cleaned because plug is removable.

4. **The flexible copper diaphram ferrule** is a simple device which solves the problem brought about by movement of jacket due to rapid temperature changes.

5. **The new model pasteurizer is insulated** with 2 inch cork board covered with galvanized iron (providing insulation is desired). The advantages of the insulated pasteurizer are:

(a) Better operating conditions because of lower room temperature.

(b) Economy in heating because radiation is reduced to a minimum.

(c) Improved appearance because paint will not blister or scale off.

Gentlemen:—Please send me your new pasteurization bulletin.

.....

I. C. R. .....

THE TROUBLE WITH SOME BUSINESS MEN IS THEY ARE NOT SET TO GO.

pasteurized mix referred to. This product incites, impels and brings out the full cream flavor of every mix. It further dispels all trace of butter flavor in a reconstituted cream or butter emulsion, and also neutralizes condensed or milk powder flavors. It imparts to every mix that delicate and pleasing finish, always found in a fresh egg mix. Its effective blend of every added flavor into the richer tasting cream flavor has gained for this improver an expression of greatest satisfaction by manufacturers of ice cream. It is being said by many, that it imparts a taste of cream richness to a degree of intellectual relish. By inciting or bringing out a richer cream flavor and neutralizing all forms of milk flavors it has unfolded to the manufacturers of ice cream an opportunity of producing the best products possible.

This cream impellant contains 5 per cent of solids and may be added to a mix while being pasteurized. It is quickly and completely soluble and becomes active immediately and does bring out the improvements named. It may be safely said that it is active goodness imparting a richer cream flavor and clarifying a mix of all unpleasant after-tastes. To all who desire an ice cream of a distinctive quality, or to those who are seeking a product that is competition proof, I suggest that they consider the addition of ice cream improvers.

The days of better ice cream, of richer flavors and better texture as produced by these improvers are here.

They do improve and are entitled to your consideration.

SMALL REFRIGERATING MACHINERY AND ITS APPLICATION TO THE ICE CREAM INDUSTRY.

(Continued from page 38)

operating expense and more or less consequent dissatisfaction.

The concern that attempts to refrigerate old style fountains will quickly come to grief. It would be comparable to placing a stationary gas engine on a two horse truck and call it a motor truck. The results in either case would be bound to be unsatisfactory, both to yourselves and your customers.

The Delivery Truck.

Many of you Manufacturers have trucks of from one to six tons in capacity and I wonder if you realize the number of hours these trucks are standing still while the driver is carrying ice and salt into your customers store? One Manufacturer gave me actual figures a short time ago obtained by service recording instruments, which showed that the average time in transit of their thirty or more trucks was not more than 90 minutes out of the working day. The large trucks handled roughly 450 gallons of cream per day and carried three tons of ice and a half ton of salt. Practically three times as much salt and ice by weight as the product which you sell. With an average of thirty five stops per truck, this makes an average of thirteen minutes to the stop and two and one half minutes between stops.

How much of this time was consumed in carrying in the ice and salt and in taking care of the muss caused by it. If the average stop were cut to less than four minutes, how much more cream could be delivered by the same truck, or how many trucks and drivers could you dispense with, and how much more ice cream could you make and handle with the same refrigerating machine equipment if you could use all of your equipment, or practically all of it, for making and hardening ice cream instead of ice making? Can you figure roughly what a saving this would mean to your business if you could cut the present cost of service from forty to sixty per cent, and these figures should be conservative, and what a source of unceasing annoyance would be eliminated if these things could come to pass.

The so called iceless trucks as used today are splendid in their way, but a truck can be built to hold 8 to 12 hundred gallons of ice cream and the temperature kept from 3 to 6 degrees above zero with a minimum use of ice and salt to refrigerate the truck itself.

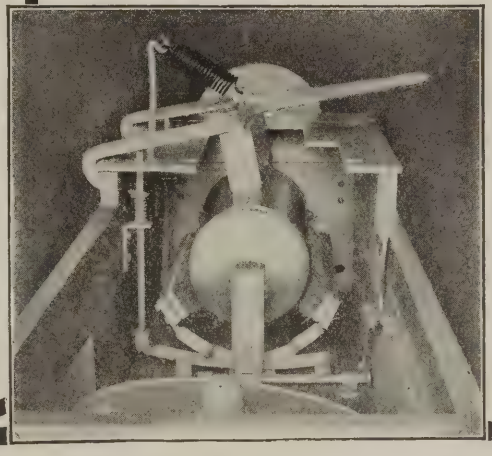
There are none who will disagree with my statements today and all are entitled to their honest opinion, but none can reasonably dispute facts which can be demonstrated.

We are not merely laying plans for you to spend more money in an endless chain without adequate return. A refrigerating machine equipment must pay its own way and show a profit or there is no place for it in the economic scheme of distribution,—it must bring a practical solution of the vexing problems of servicing your product. You must not only get more customers but you must get better ones,—or make the old customers more productive.

The Refrigerating Machine.

If we approach you with a proposition that merely increases the cost of your service, we will have a difficult road ahead of us, but if we can show you that even with the initial outlay there is a splendid profit to be made not only in the saving in cost of your service but that the machine will permit the handling of ice cream in ways and by men or organizations that previously could not be induced to handle it, then in the interest of self-preservation, you must be interested.

The small refrigerating machine is an accomplished



MANNING Can Washers

PRACTICALLY every Manning User becomes a Manning booster just as soon as the machine has had a chance to prove its worth. The longer the can washer is in use the more completely is the user convinced that the Manning is a paying investment. The evidence is in the fact that 90 per cent of the brush can washers sold today are Manning!

THE Beiler Ice Cream Company, Conshohocken, Penna. have this to say about the Manning:—

"We have used the Manning Can Washer for four years with excellent results. The motor driven machine appeals to us both for economy and efficiency. We know of no better can washer and would be glad to recommend it to our friends."

fact,—I do not here refer to the so called household, or domestic machine, but the small commercial machine of one-sixth and one-fourth ton capacity and up. It has not been until the past year or two that this has been a fact, but the development of the automatic expansion valve and its refinement have made possible the use of these small machines especially in work as we are discussing today. The automatic expansion valve is the heart of the system and without it there could **not** be successful operation,—it is an impossibility for an amateur to regulate a hand operated expansion valve on a machine of only 3 to five cubic inches of cylinder capacity on low temperature work. This automatic valve is really the missing link which prohibited an earlier use of these small machines in connection with ice cream cabinet work.

The capacity of the machine to be used depends, of course, on the work to be done, but if you have a well insulated cabinet, the work consists chiefly in removing the heat that has leaked through the walls and the additional heat which flows in while leaving the lids off in serving from the cabinet.

The temperature to be carried influences the size of the machine as a low temperature necessitates a corresponding low suction pressure and therefore a machine with larger volumetric cylinder capacity. In general, a machine using a half horse power motor, say a single cylinder affair with approximately 4 and one-half cubic inches of cylinder capacity per revolution, will have sufficient capacity to hold a well insulated cabinet at 12 to 15 degrees in eight hours daily operation. This same machine will handle anything from a three can cabinet to one of six or eight holes or one or even more cabinets holding a total of from three to twelve cans. A smaller machine would cost as much to build and to operate and there is no economy in buying toys when you have a real job to do. The machines are constructed to operate automatically. The water for the condenser turns on and off automatically with a governor and the automatic expansion valve regulates the pressure each time the machine is put in operation. The sales clerk is supposed to let the machine alone, other than to start and stop it as required by the temperature of the ice cream.

Some Manufacturers will require two temperatures, —one for the serving cabinet and the other and lower temperature for the ices and bricks or cartons. Both temperatures are possible now with a single cylinder machine.

The cost of operating these small machines will vary with the cost of electrical current but the monthly total cost will vary from three dollars to fifteen dollars depending on the size and insulation on the cabinet.

These machines must be serviced regularly, at least once a month to see that the motors are oiled, the belts in good condition and the pressures at the right point. It might be possible in the larger cities for you to combine forces for the purpose of installing and servicing these machines. This is the plan that is being talked over in one of our largest cities. This scheme will avoid useless duplication of mechanics and service men. The compressors can be sent out to the retail store completely charged and the coils in the cabinet can also be sent out charged so that it is a short process to connect up the water and electricity to the machine and get it in operation.

The cabinets may be connected to the soda fountains but this should not be done unless the fountains have at least as much cork as your holding cabinets and designed for mechanical refrigeration. You should not willingly have your machine blamed for lack of efficiency when the fault is due to poor or insufficient insulation. The fountains should be piped up for direct expansion, but one method is to use a small brine cooler in your holding cabinet and pump the brine to the fountain and let it flow back to your cabinet by gravity to be chilled down again. With good insulation it will not be necessary to replenish the brine in the fountain more than three or four times per twenty four hours.

Ownership of Machines.

This phase of the topic is one that deserves more than passing consideration. Many plans have been proposed and considered. Some manufacturers cannot stand the burden of initial investment to say nothing of retaining ownership while the machines are out in actual service. Other manufacturers will consider nothing but the retention of ownership.

Assuming that the Ice Cream Manufacturer is financially able to buy machines for all of his customers, there is no question but that he should be able to tie up his customers over long periods of time and at the same time make a splendid profit on his investment. The machines should be amortized over a period of five years and even considering the cost of ownership and servicing, the machines should pay for themselves by economies over present servicing methods in from one to three or four years at the outside.

In any event, it would be physically impossible for any manufacturer to equip one hundred per cent with mechanical refrigeration within a period of several years because of the fact that almost all of the fountains now in service will necessarily have to be replaced or rebuilt especially for machine service and this will mean a gradual replacement rather than a rapid movement, therefore the investment will be spread over a period of years and not in one lump.

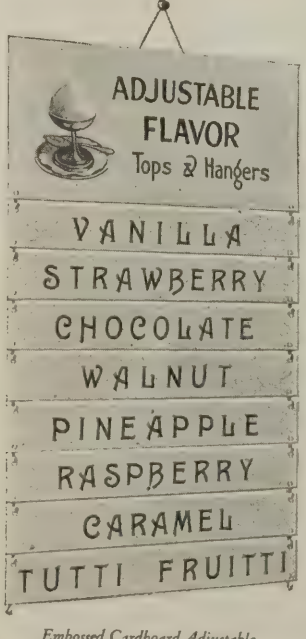
Merchandizing Policy.



We now come to a discussion of how a refrigerating machine can help in the merchandizing of your product Every red blooded firm desires to grow,—they must grow, or begin slipping, however it is not necessary to kill your competitor in order that you may live. If you have reached the limit of per capita consumption of ice cream, you can only increase your business at the expense of your competitor or vice versa. I cannot look, however, at that splendid slogan of your industry and make myself believe that you have reached the ultimate limit of human consumption of ice cream. "Eat a Plate of Ice Cream Every Day,"—what a wonderful, direct, forceful command that is,—yet if the average man cannot get it conveniently, you might as well tell him to eat a piece of whale meat every day. When or where do you want him to eat this plate of ice cream? In the home? As a vital part of his daily diet, or at the soda fountain? You may reasonably expect to increase the consumption per capita at the fountain but the great increase **must** and should come from the daily consumption of ice cream in the home, along with other food products and not merely as a palate tickler,—What a boost it would be for your sales if it were convenient for the kids to have it for their noon day luncheon, or after the evening meal, or when you come in from that auto ride in the evening or from the movies. If your product could be obtained conveniently close at hand and always fresh and in an attractive brick or carton and at a temperature that would permit it to be eaten an hour and a half or two hours after buying it, is there any doubt in your minds that the sale of ice cream could be greatly increased? Low initial temperature is the key to this question.

There is just one reason why your slogan doesn't mean all that it could and should mean to your business. Human nature will not permit itself to be inconvenienced even for so delicious a food or confection as ice cream, unless it can be kept a reasonable length of time after buying it in a single service package or carton. People will not bother with the iced up package, they do not want to be bothered to return containers. They will not long be satisfied to rush to the corner and buy a pail of mushy cream if they know that it is possible to obtain it in a more convenient form in a package and the cream will hold its temperature long enough to enable them to eat after their meal, instead of eating it as cold condensed milk before the other food is partaken of.

You must educate your organization in the new methods, just as you have educated yourselves and your organizations in the use of other modern methods and equipment.

I sincerely believe that if you all go out after more per capita consumption in the home, winter and summer and make it possible for the great mass of people to get their cream regularly, conveniently and in a clean sanitary package you will have enough to think about without worrying about competition. You have the answer to the insistent cry for greater gallonage in your own hands.

COURSES IN ICE CREAM MAKING GIVEN AT PENN STATE COLLEGE.

Two courses in ice cream making are among those to be given at the Pennsylvania State College this year. The principles involved in the manufacture of commercial ice cream and ices will be taught by the Department of Dairy Husbandry in the School of Agriculture.

The dairy department of the college supplies much of the ice cream used in the college eating halls as well as that sold by shops in the borough of State College, and the ice cream counter on "Ag Hill" at the college is the most popular spot on the 1,000-acre campus.

In order that the Dairy Husbandry Department, in common with other divisions of the college, may be able to accommodate a larger number of students than at the present time, a plan is now under way to develop the college into a state university capable eventually of providing for 10,000 students. A building fund campaign for $2,000,000 is being carried on.

KIND WORDS FROM MICHIGAN.

Owosso, Mich., Aug. 16, 1922.

I appreciate the Ice Cream Review very much and I think you are publishing one of the best journals offered to the ice cream trade.

Yours very truly,
J. J. McDONALD.

Editor's Note—Mr. McDonald is president of the C. A. Connor Ice Cream Co., Inc., and is one of the leading spirits among the men who are advancing the industry in his state.

ICE CREAM FROM AN ADVERTISING STANDPOINT.

Extracts from Publication of Parker-Brawner Co., Washington, D. C.

It is probably safe to say that not one ice cream manufacturer out of twenty is realizing anything like the possibilities in ice cream advertising. To make it definite, probably nineteen out of twenty could increase business from 25 to 50 per cent with very light additional expenditure. Any number could double or treble their ice cream sales.

By no means is this a matter of simply buying advertising material. It is not even a matter of buying one particular kind of material, although that may be a big factor.

It is not a matter of size of the company, for there are plenty of concerns that are large as a matter of capitalization and yet have been going backward constantly.

Several months ago a leading periodical published an article by the president of a very large corporation which had developed in a few years from a small concern, on "Why We Put Selling First." The outstanding feature of their experience was the great number of years during which they had a product that was one of the best, with no success in a big way until they made selling the most important part of their work.

Practically all ice cream manufacturers in the country are buying advertising material, yet hardly one-tenth have a real, definite advertising policy, with the purpose of making big development in business.

Success on a big scale means that all the advertising must be built around one real idea—that it must have effect as a whole.

Big success is simply a matter of creating the impression that one particular ice cream is unusually good. There is a product which the writer sees advertised every day by rather dingy-looking signs which are shown at a great many different places, and yet there has never been anything about the advertising to give the slightest inclination to buy it. Nearly everyone is familiar with such advertising. Old rusty signs make one feel that the product must be out of business. On the other hand, the use of flaring, screaming red-lettered signs for general advertising is declining. Advertising by wild stunts that mean nothing has been discarded by good advertisers.

In other words, big success is not simply a matter of attracting the attention and directing it to a product. It is that but more. It is the impression conveyed. Most people would undoubtedly be astonished if they realized how many of their actions are governed by impressions that they have received almost unconsciously through advertising—passing by a window with a good display or seeing such a display in a store, which takes only a few seconds and yet leaves its share of the impression.

But it is not a matter of the impression given by one piece of advertising. It is the impression given by all the advertising as a whole. That is why it pays, if any advertising is done at all, to have a definite advertising policy carried out continuously. Advertising that jumps from one thing to another, which follows out one idea for a time and then another, can never have the fullest effect.

A real advertising policy means that it is absolutely necessary to give at least some amount of effort to make the dealers get the most out of it—to see that the displays go up and that they stay up or are moved from store to store so that the fullest returns are gotten from them.

It is probably true that a great majority of dealers do not realize the possibilities in selling ice cream, many of them are strongly pushing other things. They have been sold on the convenience of package goods which come to them all ready to be handed over the counter with little or no effort. They have seen these goods advertised attractively in magazines and take it as a matter of course that they should go on advertising them, without thinking of what could be done in pushing ice cream.

They have been stocked up with toilet articles, cigars, cigarettes, candies—from none of which they make the profits they can make from ice cream—and they look upon the ice cream as something that is renewed every day no matter how much they sell, without a thought of the increased business that is possible.

It has not occurred to them that, besides getting greater profits from it, the ice cream they buy is turned into money immediately instead of having to be carried in stock for weeks or months.

Some dealers feel that the soda fountain in a store is enough to let the public know they have ice cream for sale. Their idea is simply to show what they have on hand, and carrying out that idea with other articles they fill their windows with miscellaneous junk of all kinds.

A window may be made to represent an idea. It may convey one definite impression—just as a magazine page does. And a good display, not simply made to show various packages and other things in fancy arrangements but which is devoted to advertising one thing, and in which every part of it means something, is one of the biggest factors in influencing the sale of anything.

By no means, however, are all ice cream dealers poor business men. There is a city in the Middle West where the ice cream manufacturers themselves do not believe in advertising, in which one of the dealers, the owner of a chain of drug stores, spent his own money this year for ice cream display material. Such a dealer will get big results from advertising. And efforts by the manufacturers to see that other dealers show displays to best advantage and get the fullest value out of them may easily mean double the results from the advertising. In some cases it may mean five or six times the results.

Of course to some extent this is a matter of educating the dealer. To a greater extent it is salesmanship and ordinary routine work on the part of the outside man. Some manufacturers whose appropriations are very small, so that they can only afford a very small quantity of displays, feel displeased when those displays stay up in the windows only a week or ten days. Yet it is easy to arrange for the outside man to move the larger displays from store to store, which at least doubles their value. Of course the particular problem is different with every manufacturer. But it is a matter of advertising policy.

From the dealer's own standpoint it means much for the manufacturer to have a real advertising policy. One good window display not only sells more ice cream but makes people form the impression almost unconsciously that he sells the best ice cream. And just as he helps to build up the impression that that ice cream is unusually good, he creates the impression that he sells the best and builds for his own store.

This increased ice cream business will mean big increases in a store's business in all lines, by bringing more people into the store, making more customers who are really good customers. And the dealers need to know that their interests and the ice cream manufacturer's interests are inseparable.

Good displays can practically always be gotten up in the windows and inside the stores. It sometimes takes salesmanship to see that they stay up to best advantage so that both dealers and manufacturers get the most out of them.

But with a real idea and such a policy it is certainly possible to create a real impression and make it widespread, and in doing so, beyond doubt, lie the big possibilities for the individual company today.

Our Pledge

That each lot of Standard Gelatine we ship you, will be of a uniform, high-grade quality. That this well-known characteristic will, at all times, be so dependable as to further enhance your confidence in us. We regard this confidence too valuable a trade asset to jeopardize at any time.

That we hold true to this pledge is best known by our many satisfied customers who order, "same as last."

GETTING THE BUSINESS IN YOUR OWN HOME TOWN.

(Continued from page 34)

Ice cream was first manufactured in that town some fifteen or eighteen years ago. None has ever been shipped in. The owner of the plant has a bakery shop in connection with his ice cream business and has competition in the bakery line, but none, whatever, in the ice cream department. I think that more can be gained by working closely with each dealer than in any other manner, and help through the Commercial Organizations is the next step to take, if necessary.

* * *

Sell Them on Quality.

My impression is that there is either something wrong with the people of that city, or with the manufacturer himself.

If this were my case, the first thing I would do, would be to see that my plant was equipped with the most modern and up-to-date machinery, and pay special attention to sanitation.

I would visit each dealer personally, and would then invite them all to a dinner, either at my plant, or at a hotel, and try and find out what the trouble might be. My next step would be to send a letter to every address in town, soliciting their business, and inviting them to visit and inspect my plant.

My last and best bet would be to make just a little bit better Ice Cream than the other fellow, and if this failed to get the business, I would be convinced that the dealers are buying cream at a lower price elsewhere.

* * *

Try to Cash In on Free Advertising.

If the manufacturer whose troubles have been so ably discussed, would talk "shop" as did the supply man who wrote the letter below, he might wake up some fine September morn and find a hammer in his horn.

More than likely your local ice cream manufacturer in the small town failed to realize that it was not enough to just simply make a fair brand of ice cream for the good folks who came to him for it, but that he needed to advertise his products extensively, doing it under his own name, not only to increase his trade but to hold his old patronage as well.

Without a doubt he failed to secure attractively printed KVP Genuine Vegetable Parchment wrappers for his brick ice cream. Likewise he overlooked the attractive printing up of his bulk packages, which publicity would work for him while others slept. All this, coupled with a good product, would make him so well and favorably known that there would be no room for at least so many newcomers in the business.

Undoubtedly the above information is just what you want so far as we are concerned and now, we shall be on the lookout for your letter asking why in thunder we don't tell your readers about "that good KVP Genuine Vegetable Parchment" in the Ice Cream Review.

Quality Building Plans

A building is the product of the plans and specifications just as ice cream is the product of the ingredients and process of manufacture.

If you desire to market QUALITY PRODUCT ice cream you know it is necessary to use good materials, skilled workmanship and a properly planned and equipped plant to produce it.

As your plans are so will your building be—but don't overlook the fact that your plant has to stand a long time—mistakes in the plans are permanently fixed, while a mistake in compounding your ice cream mix one day may be corrected the next and so entail no permanent loss.

Plans poorly designed, half made and indefinite are expensive.

* * *

More Super-Service.

In order to get this local business I would have an opening day, invite the public giving them some ice cream to eat.

After this I would cater to the retail trade deliver ½ gallon and gallon lots to their homes. Also sell brick ice cream at the plant. Advertise in my daily paper, and put a slide in the moving picture show. And in making deliveries would make them promptly and have ice cream well packed and delivered in good condition. After the public gets your ice cream and calls for it your dealer will have to handle it. You earn your money here spend it with your home merchant which will help to build a larger and better city. Call on your local dealers be friendly and in this way I am sure you can win them over.

* * *

Not All Dead Ones.

There simply is no positive answer to the question asked, except to say that it all depends upon circumstances. However, the same general rule applies at least to a certain extent to any manufacturer who is making a big success in selling ice cream.

In other words, it is not probable that all the dealers in this manufacturers particular town are dead ones. And as soon as they see that it is to their advantage to buy their ice cream from this manufacturer—see that they can get ice cream of the best quality from him, or especially that people believe it must be of the best quality—they will come over to his side.

The problem is basically that of building the impression that his ice cream is exceptionally good, just as it is with any manufacturer, although the details may be slightly different.

* * *

"A Prophet is Not Without Honor Except in His Own Country."

This seems to apply quite fully to the ice cream manufacturer who does not enjoy the local business of his home town. Fortunately this manufacturer is not alone in his sad plight and we will almost every day find manufacturers in various lines of industry who are in the same predicament. The condition is accounted for by the fact that it is human nature to feel that distant fields are more appetizing but as we draw nearer to them we find the same old stubbles as there are at home. Competitive conditions are just as hard to overcome and the same sales methods being used as they have elsewhere.

The one remedy would be to put forth the same intelligent effort at home that we do abroad coupled with plenty of local advertising and an appeal to patronize home industry. With quality, price and service being equal there is no good reason why the local manufacturer of ice cream should not enjoy the greatest percentage of local business. Outside manufacturers must surely make some absorption or sacrifice and loyal townspeople can be made to appreciate the many advantages of patronizing home industry, providing it is presented in a proper and acceptable manner. The important factor, however, is LOCAL ADVERTISING.....

* * *

Advertise! !

A great majority of the ice cream plants located in the smaller cities, think that it is unnecessary to advertise, hence, when outside manufacturers try to ship into the home towns of the local manufacturers, they come in with some kind of selling and advertising campaign that creates a demand.

Unquestionably there is some price cutting on shipping business but should not exist. This, however, will not be eradicated until such time as the State Associations are 100 per cent strong in membership and then some sort of concerted action can be, and undoubtedly will be taken in this matter.

* * *

Sell The Home Folks First.

The first thing I would do, would be to strike up a personal acquaintance with all the dealers and treat them with all the courtesy that I could and then I would give them prompt service and sell them ice cream at the same price I was selling the outside trade, providing it was a small town and they didn't require packing service. The ice cream being equal, I would give the dealer such service that he couldn't possibly pass up buying my ice cream. Too many small ice cream plants want to hold up their local trade and meet competition on the outside. We always take the stand to take care of our own family first.

* * *

Join Their Fraternities.

In my opinion if he makes as good a cream as his competitor as you state and still can't get the business—he attend all the Rotary meetings and Lyons club meetings and be such a good fellow and in a nice way let them know he is in their city to help promote and upbuild the city and in this way they would certainly favor local manufacturers in preference to outside manufacturers—unless the retailer surely wants to buy specials and buys outside regardless. Many, many reasons can be given for those retailers buying outside and many, many ideas can be advanced as to how to meet this condition so here is one of my ideas.

* * *

Something Wrong With His Methods.

It is the writer's opinion that the reported condition is due entirely to some local cause, probably within the ice cream manufacturer's own organization.

Frankly, we believe it is an unusual situation when local distributors practically boycott a local manufacturer who offers them equal quality and equal price in competition with outside concerns. On the face of it, it would seem that there is something about his business methods that they do not like which he surely should be able to discover.

* * *

Exclusive Sale The Cause.

This condition is the result of numerous manufacturers starting dealers on the exclusive sale to get their cream introduced.

Many manufacturers still practice the old fashion idea of only one dealer in each town.

In my opinion all manufacturers should be open to sell to any or every dealer that sells ice cream at retail, when this day comes our local factories will get the patronage which they are entitled to.

Either competitors are coming in his territory with a discount of some kind or something that is a benefit or inducement. A whole lot of business men think by having a different brand they can get more trade or that the out of town man does picture show advertising, newspaper, etc.,

"NO MAN IS HAPPY WHO DOES NOT THINK HIMSELF SO."—PUBLILIUS SYRUS.

free of charge. Did you ever know that when a man buys your cream from another town he immediately asks for exclusive rights? For what reason we do not know. Naturally everyone thinks his own ice cream is the best, but at the same time there is other ice cream sold so why do they demand exclusive rights.

* * *

A Darwinian Doctrine.

The fact that this place is called a town and not a city seems to indicate that it is not large. If so, and with six brands selling, it is a wonderfully good town, and the local manufacturer has been very lax in previous handling of his local trade or has fallen down on quality, or price cutting or icing competition is on.

If the former condition is responsible, it is up to the local manufacturer to change his methods quick. Talk local production on equal or better quality and service—and hustle. If the latter condition exists, I'll say he is up against a hard proposition and one that is not by any means confined to this manufacturer.

"Sit tight" on price cutting. Let the other fellow slash and take his loss. Put out quality and give service and the trade will learn to appreciate this and be willing to concede a fair profit and stand by you. Above all, advertise wisely, hustle every minute and give service—that's what counts in any business and to meet any competition.

There is plenty of competition among ice cream manufacturers in Michigan and some of it not based on business ethics. I have been in small towns and found small retail stores with three cabinets and selling three different brands, all made elsewhere—and the local manufacturer trying hard to struggle through. Some unidentified "germ" seems to have gotten into the ice cream manufacturer's system this year that has not been so noticeable heretofore. Perhaps time will eliminate this, but more likely it will be as it always has been, "A survival of the fittest."

* * *

Get at the Real Cause.

Before being able to answer this question one should know more about the local conditions. However, I think tnat this ice cream man should find out the real reason why all the retailers, with the exception of one, prefer to deal with a concern that theoretically cannot give them as good service, or a better cream than he could.

If this is not true it is up to this ice cream man to meet competitve conditions and if necessary go them one better during a period long enough to get that which should be his from a geographical point of view, as well as sectional loyalty.

He might have to do considerable personal work among his trade as well, but if he secures his retailers he should be justified in the end.

Anything worth while can be sold if enough effort is put forth to do it, and if it is worth while, the effort should be made.

* * *

Give Them What They Want to Pay For.

The condition which you mention evidently rests with the MAN. He possibly does not cater to the wants of the local people. He wants to give them what he has to sell and not what they want to pay for. He probably is not liked personally. His out of town customers do not get a change to see him often and he gives them more attention to their wants. In other words he is "in wrong" in his city. To get the business I would suggest to him two things—personality and courteous service.

* * *

Just such conditions exist in several towns in my territory. I hear the same cry and usually offer the same solution, "to-wit." Forget the local user, increase your outside business to your utmost capacity, be independent, show the local one cylinder brain you can exist without him.

As he notices your increased business, naturally an increased bank account, they will cater to you instead of you at present crawling to them.

* * *

He is lacking in personality. If his product is as good as the other, make the advantage in service. Sell the public and not the dealer. Put the majority of his advertising in the product itself. Don't offer something cheaper, but get more money for it.

* * *

While I never had this experience, I would advertise my brand very judiciously, I would get the people to visit my plant, I would appeal to the home people to buy a home product, I would meet the outside competition and give the dealers a packing service and make the best goods obtainable. In short I would get the business some way and would keep on until I did. It can be done.

* * *

If conditions are as stated I would advise the man himself to gain the popularity of dealers and people. If his product is better than others the fault must lie with the manufacurer.

* * *

Must be a matter of salesmanship or there is something wrong about the man himself. Maybe he is too well known in his own "Home Town."

* * *

I would suggest this man getting a good Hickory Club and go out and use it.

Quality

Because—

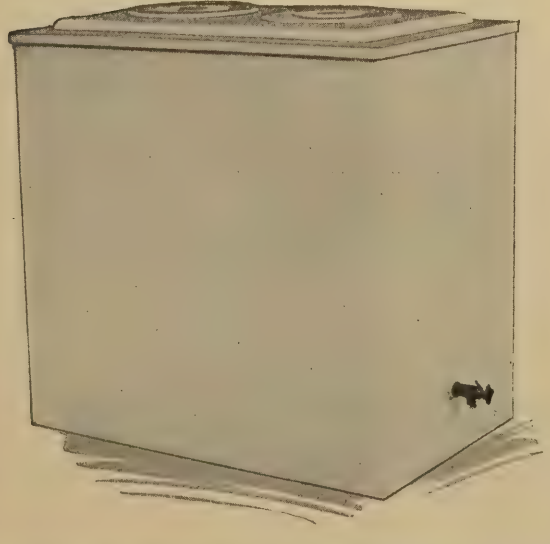
Packaged cream of any selected flavor is instantly dispensed right from the coldest part of the freezer —no fumbling around for the flavor wanted.

The oldest cream is always dispensed first.

Zero temperature—no soft cream.

Keeps cream in perfect condition —a valuable asset for increasing the carry home trade.

Freezer accommodates packaged cream in any form—bricks, eskimo pies, cylindrical packages in quarts, pints, etc. Where necessary special size containers are made.



Cream container proper consists of a centrally located receptacle surrounded by ice on all four sides, top and bottom, and is arranged to provide individual compartments for cream of various flavors.

We guarantee these Ever-Keep Freezers if iced properly once in 24 to 36 hours to keep cream in most perfect shape.

Ever-Keep Freezers are carried in stock in 32, 40, 48, 56, 60 and 70 quart capacity.

Patented Jan. 24, 1922

A full line of non-equaled ice cream cabinets, corkboard insulation, metal lined, Everlasting Redwood exteriors carried in stock in all sizes. Stock finish is golden oak. Can be furnished in mahogany, white enameled or any other finish desired.

Battery of Pfaudler Glass Lined Sweet Cream Pasteurizers — part of the up-to-date equipment of the Gridley Dairy Co., Milwaukee, Wisconsin. They are satisfied as their letter indicates:—

"We have installed three of your 500 gallon glass lined tanks which we are using as sweet cream pasteurizers and find them to be entirely satisfactory. The impeller type of agitators appear to give the proper agitation without injury to the cream. ***We are heating these tanks with exhaust steam at 2 to 4 pounds gauge pressure which shows a decided saving in fuel consumption."***

SEE PFAUDLER AT THE SHOW!

There will be much at the Pfaudler booths this year to interest the dairyman or ice cream maker. The Pfaudlerette will be on hand for your inspection; and will be exhibited also

at the Cleveland Ice Cream Show.

Pfaudler

PASTEURIZATION & TRANSPORTATION—

PASTEURIZATION and Transportation—these are the two fields of operation in the dairy industry, which, today, are the subject of the most discussion and concern;—they are the two which usually cost the dairyman most;—and the two into which Pfaudler has penetrated most deeply.

As far as pasteurization is concerned, the net result of Pfaudler's work with glass lined equipment has been:—

1. **Reduction in time, labor and cost of operation, as involved in heating, holding, cleaning and general routine.**
2. **Improvement in the flavor of the pasteurized product.**
3. **Greater sanitation as reflected in lower bacterial counts.**

In the field of transportation:—

1. **Elimination of waste labor formerly expended in can handling.**
2. **Saving of much milk formerly lost in spillage and adherence.**
3. **Cleaner and purer milk through the elimination of "en route" contamination and temperature rise.**

Glass lined equipment in these two fields has been the boon of the modern dairyman. It has been instrumental in keeping his costs down and the quality of his product up;—it has given him a real chance to make money, and meet the demand for lower-priced milk without a loss.

Let us tell you what Pfaudler has done in these fields. Send for our booklet, "The Story of the Pfaudlerette", describing our new, small-unit pasteurizer, and our booklet, "A New Era in Milk Transportation", giving the complete story of bulk handling.

The Value of Good Vanilla Flavor

It produces that delicate, delightful, pleasing taste peculiarly characteristic of only Hudson's Vanilla flavored ice cream. Through all the seasons it is the most generally desired. It stimulates sales, stabilizes demand and is, in reality, the one flavor which makes for greater consumption of ice cream. Around this primary flavor the ice cream industry has grown and prospered, and will continue to do so.

Its universal popularity, however, incurs a responsibility. The flavor must, necessarily, be of uniform, high-grade quality all the time. Scientific research, endless laboratory analysis and tests, practical demonstrations, and experience have thoroughly established this fact—Good, dependable, quality Vanilla Flavor can only be obtained by the utmost care in the selection of raw materials, and the correct laboratory proportioning, blending and balancing in the manufacturing process, combined with expert knowledge and skilled workmanship. There are no short cuts, no half-ways.

"Give me a Lick"

Hudson's Vanilla Flavors *for thirty-four years*

"Ever since I began this business of nine, I have always purchased my vanillas from the Hudson Company. In all these twenty-five years they have never failed me." These remarks made by an ice cream manufacturer strikingly portray the position we hold in the industry. Such constant association of quality and satisfaction with a house for so many years can only be based on this fundamental fact—that Hudson has stood for the best in Vanilla Flavors. Certainly, our thirty-four years of specialization in the manufacture of Vanilla Flavors has qualified us to produce good flavors. And, naturally, this explains, also, why so many ice cream manufacturers say "Hudson" when they think of Vanilla Flavors.

Hudson's Vanilla Products are sold unreservedly on a Guarantee of Satisfaction. There are two reasons why we can make this guarantee: (1) From laboratory and practical tests we know what the quality is. (1) Users of Hudson's Flavors always are satisfied.

Always Popular

is Vanilla flavored ice cream in the home. Keep it so—remembering that here your product is judged, as to its goodness, chiefly by "the taste." And only good, high-grade Vanilla flavor will produce in ice cream the taste that keeps and pleases.

A Cordial Welcome Awaits You

National Dairy Exposition
St. Paul—October 7-14—Minneapolis
Booths Nos. 144-145

The Association Ice Cream Supply Men
Ice Cream Week Cleveland—October 16-21
Booths Nos. 131-132

We will have exhibits at both the National Dairy Exposition and at The Association of Ice Cream Supply Men's Exhibition. These are important events. Arrange to attend both. You will be well repaid. **Ice Cream Week,** Cleveland, October 16-21, is of special interest. The National Association of Ice Cream Manufacturers will hold their annual convention during the week. This coupled with the largest and most complete Exhibition by The Association of Ice Cream Supply Men warrants your attendance. Come to Cleveland. We will welcome the opportunity to see our old friends again, to renew acquaintances, to meet new friends and to extend the hand of good-fellowship to all. Make our booths at both Expositions your headquarters. The latch string is out. Our representatives to whom you have so generously extended many favors will be there to greet you. Above all, we want you to know that you are welcome and that we are eager to see you again.

There's a genuine satisfaction in knowing that Hudson's Vanilla Flavors have been so highly regarded for a long period of years. Naturally we prize the reputation we have earned. Obviously we can not afford to jeopardize this reputation. Therefore, Hudson's Famous Vanilla Ice Cream Flavors, Tonka and Blends No. 52 Special (Extract and Concentrated) shall always be of High Quality, backed up by our Guarantee of Satisfaction.

Attention of Mr. C. L. Patterson, Sales Mgr.

Gentlemen:-

The two Jensen Square Vertical Pasteurizing Machines installed by you in 1920 for use at our Mont Alto Sanatorium, have proven very satisfactory. Both circulating units and both pasteurizing machines are in daily use.

We are pasteurizing at a minimum temperature of 145° Fahrenheit for 30 minutes without affecting the flavor of the milk.

Each patient is now using over one and one-half quarts of milk daily.

Very truly yours,

Edward e Martin

"Down the street

a block and just around the corner you'll find the place where you can get that ice cream." . . . . . .

B-F Vanilla Flavor used in "that" ice cream regularly had left its tell-tale impression. Folks remembered "that" ice cream as something delightfully pleasing and enjoyable. They wanted it and sought it. Hence, the street urchin's answer, as quoted above, to the party inquiring where they could get "that" ice cream.

Your ice cream, B-F vanilla flavored, will likewise induce folks to desire it and to seek it. B-F Vanilla Flavor is a high-grade, reasonably priced flavor which produces that delicate and delicious aroma in ice cream which establishes a preference for your particular ice cream. And you can depend on B-F Vanilla Flavor to do this —its quality is always uniform.

FREEZING THE MIX.

(Concluded from page 28)

freezer in a sloppy condition, which when hardened would be coarse and snowy. Mix that has been naturally aged and ripened makes ice cream of the very best quality, the overrun of which can be easily controlled. We have found that the best method is to highly pasteurize the mix, homogenize, and cool to a temperature below 40 degrees F., then store in sterile vats or cans held at low temperatures, for a period of from 2 to 5 days or longer, if possible. When it is not possible to age it naturally this way, we have used artificial improvers to hasten the time of ripening with fair results.

* * *

We wish to say that we cannot notice any difference in the quality of the ice cream when frozen at zero brine or when frozen with 5 or 6 degree brine. We freeze our ice cream until the desired temperature is reached whereupon the brine is shut off and the cream whipped until the desired overrun is obtained. We do find, however, that where a very low temperature brine is used the cream may be cooled down to the proper temperature but will warm up much faster, due, we presume, to the fact that the fat is not thoroughly chilled in the short time it requires to incorporate the fat with the low temperature brine. Therefore, there is not the actual saving in time with the low brine which one would naturally expect inasmuch as we have to freeze to a lower temperature when using the zero brine than we do when we use brine at a temperature of five or six degrees.

We have never frozen a mix the same day that the mix was made. We use a ripener and hold the mix over night or in other words, mix made one day is frozen into ice cream the next day. We find that by using ripener and holding it over night, we can make a better quality of ice cream than we can make without the use of ripener even though the mix is held from forty-eight to seventy-two hours.

* * *

We find that the use of a low brine on the freezer is advantageous from the standpoint of a slight saving in time on each run.

We have tried both a high and low brine temperature, and as far as we have been able to notice there is no appreciable difference in the quality of the ice cream produced, and since we find the low brine shows a tendency to save time we have adopted that method as standard.

In regard to your second question, the verdict is undoubtedly in favor of the aged mix. We find that the best results are obtainable from a mix which has been held at from 38 to 42 degrees for about 24 hours. Forty-eight hours ageing shows a slight increase in overrun, but longer ageing; that is, 60 to 72 hours, shows no additional increase in yield, and a tendency to develop old flavors unless the mix is watched carefully. The best method is to produce mik with low acidity (not neutralized) then to age for approximately 24 hours at from 38 to 40 degrees. Such a mix, providing the formula is correctly proportioned to begin with, will give no trouble with overrun.

* * *

It has been the writer's experience that low temperature brine on the freezer and reducing the cream to a temperature and then turning off the brine and whipping to the desired overrun, can be done in a shorter space of time and I believe the overrun can be secured with less difficulty than is ordinarily required with a temperature brine. If one has a homogenized product to start with the results are much better and a firmer quality can be secured.

In answer to question No. 2, the former will not give the overrun that the latter will by at least 15 per cent. This fact, however, cannot always be helped in the rush season. There are certain ripeners which can be used to give the same viscosity that the longer time will naturally give.

* * *

Relative to your first question concerning the temperature of brine in freezing, it has been our experience that when using a low temperature brine, approximately from 6 to 8 degrees Fahrenheit in freezing ice cream for about 10 minutes and then turning off the brine, and letting it beat up, we obtain more satisfactory results than we do by using the brine of about 14 degrees temperature, and freezing until the batch is ready to draw. We find that we can control our overrun a little more satisfactorily by using cooler brine, and at the same time we save quite a little time in the freezing operation. It takes just about 15 minutes to load, freeze and draw a 40 quart freezer of ice cream.

Concerning question number two in your letter, relative to the freezing of freshly homogenized mix, compared to that of freezing a mix aged 24 to 72 hours, will say that there

"BEST MEDIUM of ADVERTISING"

said the Frozenpure Ice Cream Co., of Louisville, in their letter dated June 14th, 1922.

No wonder they said this and other things about the

"SURVITOR"

Think of reaching 50,000 ice cream eaters with a *very effective* "ad" for less than 1-6c each.

Think of pleasing many dealers. Think of some new and added ice cream sales.

THEN get free data on the Survitor and be able to put these thoughts into a larger bank account.

The DAIGGER CORPORATION

(Mfrs. of Washburn's Ice Cream Improver)

CHICAGO U. S. A.

is a very noticeable difference in freezing a mix which has been aged, and a mix which has been freshly pasteurized and viscolized. It is the belief of the writer that the pasteurization retards the swell more than the viscolization in a freshly frozen batch. There are some concerns who control their batch by acid, therefore, obtaining a uniform overrun by knowing just what acid the cream contains. Of course, if this method is pursued, you can freeze cream directly after pasteurization, if your acid was up to where you wanted it. Of course the lactic acid makes for viscosity. That is the thing which you have to have in cream to obtain yield easily.

* * *

Ice cream frozen at a brine temperature from six or lower degrees, then turning off the brine to whip to 100 per cent overrun does not give the proper result. In this case the cream will be sandy and after eighteen hours will form small flakes of ice all through the frozen product. We find we can get good results freezing at this low temperature by whipping the mix about four minutes after first putting it into the freezer, before turning on the brine; then whipping it about five minutes after the cream has finished freezing.

We also find that a freshly homogenized mix will not give the smoothness and overrun as an aged mix without using more than the required amount of fresh solids and gelatine.

* * *

In regard to temperature, we find that we get the best results with a temperature of from 4 to 5 above zero and by partly freezing the batch and then shutting off the brine and whipping up to the desired volume, and then finish freezing, we are able to get a better and more uniform product.

We are able to get a much better overrun on a mix that is held for 24 hours than we are if the mix is frozen in 12 hours, if able to hold 48 hours the yield is better and the finished product has a better body.

* * *

Our experience has been that we get much better results in freezing ice cream when the brine temperature is low, turning it on and reducing the temperature of the mix to about 26 degrees F., then turning off the brine and whipping the mix to the desired per cent of overrun.

We find it much more difficult to secure the desired overrun when it is necessary to use a mix which is less than 12 hours old. We find it much better to age the mix at least 24 hours before freezing.

* * *

We have found by practical experience, the best method for us to pursue in freezing cream is to have the temperature of the brine around eight degrees, and allow it to flow freely while the batch is being frozen.

In answer to your second question, there is no comparison between freezing freshly homogenized or viscolized mix, as compared with one that has at least twenty-four hours age. We must give the mix time enough to recover its viscosity. There have been times when we of necessity froze fresh made mix, but our results were around 20 to 40 per cent less in swell.

* * *

In answer to question No. 1: In freezing the ice cream with a low temperature brine until the proper temperature in the cream is obtained, and then turning off the brine and whipping to the desired overrun, my experience has been that this can be done with good results but I do not believe that very much time is gained this way.

Question No. 2: Freezing cream from a freshly homogenized or viscolized mix can be done with the very best results if the mix has the desired acidity, but if the mix is made up from entirely fresh ingredients it will always be difficult to get the overrun and flavor. When using either milk or cream not perfectly sweet I always freeze the mix directly from the homogenizer and get very good results, but when all ingredients used are sweet I prefer to have it aged for twenty-four hours at least.

* * *

We think we get better results by employing a low temperature brine, reducing the mix to the desired temperature, shutting off the brine and finishing the freezing process, thereby getting a more satisfactory overrun and a better texture.

We seldom use freshly made mix; when we do, we find the texture of poor quality and overrun difficult to secure.

* * *

We find in using a low temperature brine, shutting off the brine, whipping the cream to the desired overrun, gives us a better grade of cream in a shorter length of time than using low temperature brine.

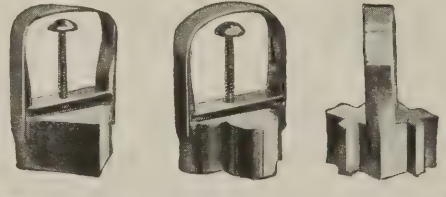
In freezing a freshly homozenized batch there is considerable loss of overrun, while if the batch has been aged from 24 to 72 hours we are always absolutely sure of getting the required amount of overrun.

* * *

Replying to question No. 1, we would say that from our experience ice cream that is frozen with a very low temperature brine, the brine being then turned off allowing the cream to whip up to the desired overrun, produces a product that is not as smooth as the cream that is allowed to take a longer time for freezing and we would say that the same condition would be experienced when freezing a fresh mix in preference to the one that had been allowed to age for the proper time.

* * *

In answer to question No. 1, we find we get the best results by freezing ice cream at zero temperature and bring it to the desired consistency and then turning off the brine and whipping it up to the desired overrun.



In answer to question No. 2, we find from five to ten per cent gain in overrun by ageing the homogenized mix from twenty-four to thirty-six hours.

* * *

In reply to your letter of the 10th inst., making inquiry in reference to experience we might have had in the freezing of ice cream, will advise that when hurrying a freezing, with a low temperature brine, our principal complaint has been to the effect that our yield is very vitally affected, and our cream seems to get sort of grainy. This latter, however, may be imagination on our part.

In reference to freezing cream from a freshly homogen-

"DIFFICULTIES ARE THINGS THAT SHOW WHAT MEN ARE."—EPICTETUS.

ized mix, as compared with an aged mix, will advise that we have been quite successful in obtaining satisfactory results with fresh mix, if we use artificial improvers or ripeners. However, we prefer an aged mix, not only because of the ease with which a yield is obtained, but also because of improved texture.

* * *

In relation to the first paragraph of this last letter we requested several men who are intimately connected with the ice cream business to give us their technical reasons for these conditions, and these are printed below.

Many ice cream makers seem to think that using a low temperature of brine in the freezer and freezing the batch quickly, then shutting off the brine and continuing whipping to get the overrun gives them better results than freezing at a little higher temperature and running the batch continuously until the batch is frozen. My personal experience has been that the former method is not quite as satisfactory as the method used by the majority of ice cream factories, who run the brine continuously instead of shutting it off.

A batch of ice cream mix when turned into the freezer will not begin to whip until the temperature is down to 31 or 30 degrees, and it would appear that bringing it down quickly to that temperature and then whipping it should produce the overrun. However, when the brine is shut off and the whipping continued the temperature of the mixture is liable to go up and consequently the mix may not be in the right physical condition to hold the air.

The grainy condition of the ice cream mentioned by the Iowa man referred to in your letter is undoubtedly due to drawing the ice cream from the freezer when too soft. This is every apt to occur where the brine is shut off and the whipping continued. Another result would be a lower overrun.

I had a personal experience with a condition of this kind just a week ago in an Oklahoma factory. In this particular factory the ice cream maker was not shutting off the brine, but he was drawing the freezer before the freezing was completed. He also had trouble with grainy ice cream. I demonstrated to him that he could make from 10 to 15 per cent more overrun by freezing just a little longer so the ice cream had the right consistency when drawn and also assured him that he would not have the grainy condition in the finished ice cream.

I asked him to watch that carefully and then write to me, but I have not heard from him. I am sure, however, that his trouble is solved or I would have heard from him.

If the brine is to be shut off during the freezing process it should only be during the short interval of time necessary to draw the batch from the freezer so that the last coming out of the freezer will not be too stiff and difficult to draw from the freezer.

I believe that this explanation will be received by the majority of ice cream makers as being correct.

* * *

My best results have been secured with zero brine. The advantages are two-fold: saving of time and smoother ice cream. The first would be of no advantage if it were done at a loss of yield, but that is not necessary.

If your machine is in good condition, blades true, blades laying well against the cylinder, no turned-over scraping edge—and with zero brine and your mix at about 40 degrees F., you should freeze in about five minutes. Cream, to be the right consistency when drawn from the freezer should ribbon or fold as it falls into the can. Cream drawn before it will do this is not ready to draw and will be grainy when frozen. Much of the grainy ice cream you find is due more to this than any other single cause. If you were to pull your batch at, say, five or six minutes with zero brine, you would not get any yield.

Here, then, enters the question, "How long shall a batch be in the freezer?" There is no fixed time. It depends entirely on the temperature of your brine and the yield you desire to get. To revert again to the batch frozen with zero brine in five or six minutes. Allow it to run, say, one minute longer or, in other words, freeze your batch slightly stiffer than you desire to draw it. Then shut off your brine and allow your batch to run without the brine on. Open your peep-hole in the head of your freezer and watch it start to come up. If you allow your batch to run this way for, say, two or three minutes, or even longer, you can draw any yield within reason that you desire.

* * *

Although the writer is not an experienced ice cream manufacturer he has always understood that freezing quickly with low temperature brine secured better results than the older method of using low temperature brine and freezing longer. The thing which should be watched most closely, in using low temperature brine, is to avoid over freezing the product and in the writer's opinion this is exactly what has happened at this manufacturer's plant that has caused him to complain of reduced overrun and a grainy product. Possibly he fails to take into consideration the fact that with a brine chamber well filled with exceptionally cold brine the freezing process continues for at least one minute, and on some freezers almost two minutes, after the brine has been turned off, hence, he goes below the required temperature in his mix before the whipping operation begins. We find that this frequently happens.

* * *

Our experience has been very much like that of the Iowa manufacturer, namely, that in hurrying a batch of ice cream you lose both in overrun and in quality of the finished product.

However, a number of manufacturers have recently been experimenting in the use of low temperature brine, say at zero or up to 5 below and have been getting very fine results. The method, which they employ in freezing, however, is that instead of turning on the full amount of brine, as soon as the mixture is in the freezer they split the valve and allow a small volume of the low temperature brine to circulate through the freezer. In other words, only approximately, half as much brine goes through the freezer until the point in the freezing point is reached where the required amount of overrun is shown by their tester.

It is my impression, however, that it is a very difficult matter to hurry the freezing of a batch of ice cream, as it is a well-known fact that if an ice cream is frozen too quickly large ice particles develop, which would not happen if the freezing process was more gradual.

* * *

Regarding the speeding up of production by increasing the capacity of the ice cream freezer, wish to advise that a large percentage of the ice cream manufacturers overload their freezers at present. They use too large a quantity of mix, with the result that they do not have sufficient air space left so as to permit quickly beating the cream up to the desired overrun, and, of course, to a finished state. A slightly smaller quantity of mix placed in the freezer per-

INSULATION

for

COLD TEMPERATURES

MINERAL WOOL

The best insulation is not always the most expensive; in fact, the high-priced kind may not fit your requirements at all.

MINERAL WOOL is highly efficient — low in price and can be handled by unskilled labor. Use it around your tanks, in your service boxes, on your wagon boxes, or any place where a loose form of insulation can be packed.

One Man and a *CP* Rotary Can Washer

Front View Showing Interior, No. 1 Size

No four men in your plant can complete as much work in the same time as one man with a ***CP*** Rotary Ice Cream, Milk and Cream Can Washer.

Washing, rinsing, sterilizing and drying takes a lot of time when done by hand. A ***CP*** Rotary Can Washer however performs these operations at the rate of **three or six cans per minute**, according to size of machine, and does the work much more efficiently than is possible with hand methods. The operator simply feeds in the dirty cans and removes the clean cans, without moving from the spot.

Made in two sizes. The No. 1 machine cleans six cans a minute; the No. 2, three cans a minute.

Quantity production has enabled us to quote an exceptionally low price on this washer in both sizes. It will be decidedly to your advantage to learn more about it.

Large colored broadside illustrating and describing the ***CP*** Rotary Can Washer will be sent you on request.

Derycote
PAINT YOUR PERSONALITY ON YOUR PACKAGES

is a brilliant elastic colored enamel made especially for Dairy and Ice Cream service

Handling or transportation will not cause it to chip or crack. Hot or cold water, salt, ice, brine, washing powders, etc., will not dim its lustre or impair its protective qualities. Made in 24 colors, as well as black and white or in your standard shade if our regular colors don't suit. Write for our color card and ask for a sample.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN
MEMBER

Labor Day Month—*Lets Go!*

Let's get tubs and cans "perked up" for another season of success.

Let's send them forth, here, there and everywhere, chiming out our standard color and shouting sanitation from Dan to Beersheba!

In other words—**Let's Derycote them!**

Derycote gives that distinctive touch to a tub or can that paints the personality of your brand upon the public mind.

An unpainted can or tub soon looks as rusty and delapidated as a travel stained hobo.

A poorly painted can looks like a "hand me down."

A Derycoted tub or can proclaims the aristocrat and no business ever lost a nickel by "keeping up appearances."

That's where Derycote shines—"Keeping up the appearances" of tubs and cans in close companionship with the high quality of your product.

Order enough of your standard color of Derycote to enamel sufficient tubs and cans to make a comparison with any tub and can enamel you have been using.

Compare results in **economy** and **service** and convince yourself.

THE NATIONAL PAINT and VARNISH COMPANY

mits drawing the cream quicker than would be the case where a freezer is crammed full.

In numerous tests that have been made on reducing the brine temperature, we have seen it demonstrated clearly that it does not affect the quality of the ice cream provided scrapers are perfectly smooth and scrape even. A great many factories neglect to keep their scrapers sharp and even, with the result that particles of mix freeze on to the walls of the cylinder and naturally act as an insulator; hence preventing the operation being completed as quickly as otherwise would be the case.

Ice cream can be frozen with zero brine just as well as with a higher brine; as a matter of fact, better. However, it then would be necessary for the operator to correctly control his brine flow by turning the brine on and off as would be necessary, governing his actions by the peculiarities of the particular mix that he happens to be freezing.

* * *

In regard to freezing on low temperature brine, will say that we have always recommended freezing on as high temperature brine as could consistently be used. The higher the freezing temperature, the better it is for the ice cream, both in texture and yield. Ice cream freezing is a good deal like baking. Bread baked too suddenly would have a burst crust and doughy inside. Applying an extreme cold temperature to cream too quickly will make a terrific change in the cream and the drop is so great that it has a tendency to more or less deteriorate or roughen the finished ice cream. Plainly, the less the cream is disturbed from changing temperature, the better the finished results will be in the ice cream production.

* * *

We freeze our cream at a low temperature of brine, generally about ten minutes, when it is at the proper thickness; then turn off brine and whip until our overrun is about 100 per cent. If the cream is of the proper viscosity and contains the proper amount of milk solids, you will get your overrun as well as a soft, velvety ice cream.

* * *

We have not known of any manufacturer having trouble with grainy ice cream, even though they were freezing with a low temperature brine and shutting off when frozen to the desired consistency and whipping up to get the overrun. We believe that grainy ice cream would develop when the mix did not contain the proper ingredients or have been properly treated before freezing.

Mapleine

One of the Best Selling Flavors

Mapleine Ice Cream is having a remarkable sale this season.

A Brooklyn plant has produced in a few months 96,000 gallons of Mapleine Ice Cream. A Massachusetts manufacturer has bought enough Mapleine this year to make 44,800 gallons, while reports have come from Iowa, Wisconsin, Washington, Pennsylvania—from all parts of the country that Mapleine Ice Cream is one of the best selling flavors.

Mapleine Ice Cream has good demand because Mapleine is known and liked as a household flavor. And customers who enjoy Mapleine flavored home desserts have a corresponding liking for Mapleine Ice Cream.

Your customers will take just as readily to Mapleine Ice Cream. Send us $3 for a quart trial and convince yourself.

Crescent Manufacturing Co.

SEATTLE WASH.

PETALUMA WOMAN TO MAKE ICE CREAM TO SUPPORT FAMILY.

Mrs. A. M. Simms of Petaluma, California, whose husband and son were killed in an auto accident in June, and who herself was injured so as to make it necessary for her to remain in the hospital several weeks, has returned to her home and is going to resume the manufacture of ice cream for the purpose of supporting herself and her three children.

NEW ICE CREAM MACHINE PATENTED.

A process to mould fancy designs in ice cream bricks has been patented. The inventors are F. R. Carter, O. A. Otten and John Willard, all of Fairbury, Nebraska. The process is in use now by the Robinson Ice Cream Co., of Fairbury, and appears to be working out very nicely. The inventors have not yet decided whether they will manufacture the process machine, sell the patent, or lease the process.

CONSUMPTION OF ICE CREAM CONES HEAVY.

A short time ago an ice cream dealer in Centerville, Iowa, a city of 8,486 inhabitants, made a statement to a layman that he believed 50,000 ice cream cones had been consumed in that city since the warm weather started. This number sounded so impossibly large to the man that he said he didn't believe the statement could be so.

That started an argument, which was settled by the results of an investigation. This showed that approximately 70,000 ice cream cones had been eaten by the people of Centerville since spring. One firm alone said that on hot days they had sold as many as 500 cones. At that rate it is easy to understand how this total mounted up. That's going some for Centerville. Who'd a thought it?

VOLSTEAD ACT BOOSTS ICE CREAM SALES.

Statistics compiled by the United States Department of Agriculture show that if the people of this nation are mourning the demise of John Barleycorn, they are saying it with ice cream. Sales of this healthful delicacy have mounted astonishingly since that thirsty first of July, 1918.

Figures given out by the department show that only 80,000,000 gallons of ice cream were manufactured during the entire year of 1909. In 1920 more than 260,000,000 gallons were placed on the market, an increase of more than 225 per cent. No detail figures of later date are available, but it is known that the 1920 figures were exceeded in 1921, and that the current year will break all records.

If you want a manager, superintendent, expert, chemist, bacteriologist, operator, pasteurizer man, or help of any kind, "The Ice Cream Review" can help you find the best available man. If you want a position, "The Ice Cream Review" can help you as it has helped hundreds of others to secure a good position.

FACTS ABOUT HEATHIZATION (Carbonation).

Chicago, Ill., Aug. 15, 1922.

Editor: Ice Cream Review:

In a recent issue of The Ice Cream Review there was published a circular issued by the University of Illinois which dealt with the effect of carbon dioxide upon bacteria under certain laboratory conditions. This circular bore the following foot note:

"The terms **carbonated ice cream, carbonated milk,** etc., as used in this circular, refer to laboratory products made by laboratory methods, and not to products made by commercial processes patented or otherwise."

As first published, however, this circular contained no foot note. I took the matter up with Dr. David Kinley, President of the University, and Dr. Davenport, Dean of Agriculture. I pointed out that the University's work had no bearing upon the commercial patented method of Heathization (carbonation), because the method differed, the results differed, and the words "carbonated ice cream" had a distinct trade meaning referring to product made under the Heath patents.

Admitting that a possible injustice might be done if the circular fell into unscrupulous hands, the University's authorities sent the circulars back to the printer for the purpose of adding the foot note quoted above. This foot note plainly calls attention to the fact that such commercial methods as Heathization were not referred to in the circular.

Having read the results of laboratory experiments, readers of The Ice Cream Review will be interested in reading authoritative results where the Heath methods are employed in commercial plants. Although a great deal of investigational work had proven from the start the merits of Heathization, I wanted the ice cream industry to have actual results, impartially arrived at, by scientists of unimpeachable reputation—results obtained not in laboratories, but rather in commercial plants where men trained in the new method were continuously Heathizing food products.

Among these investigations I sought one whose past work for the dairy industry I knew to be such that it would commend him to manufacturers. Some years ago when the ice cream industry faced a serious crisis, it enlisted the services of Dr. Herbert Pease, then in charge of the Lederle Laboratories of New York, now known as the Pease Laboratories, Inc. I knew that Dr. Pease would be glad again to serve the ice cream industry by accurately determining the value of Heathization bacteriologically.

Dr. Pease conducted his tests upon Heathized and ordinary ice cream, samples from the same mix in one of our licensee's plants. The results show that the ordinary ice cream had on an average over 100 per cent more bacteria; four times as many molds; and ten times as many B. coli. In butter there was nearly 400 per cent more bacteria in the ordinary butter made from the same cream, and this ordinary butter had deteriorated after two weeks in the ice box, so that it had a decidedly bad flavor, while the Heathized butter was still fresh and sweet, of excellent flavor and aroma. This shows the results obtained with correct application in a plant licensed to Heathize.

Dr. Weinzirl, of the University of Washington, reported an average of from 30 per cent to 100 per cent more bacteria in the ordinary over Heathized ice cream made from the same mix; the degree of reduction depending upon the intensity of the application of the Heathization principle.

Doctors G. W. Lougheed and Gordon Cameron of the Department of Pathology, Toronto General Hospital (affiliated with Toronto University, the largest in the Dominion) also investigated the bacteriological value of Heathization in a Canadian licensee's plant. Their findings showed several hundred per cent more bacteria in both ordinary ice cream and ordinary butter made from the same materials.

There are no greater authorities in America upon flour, bread and baking than Doctors Wesener and Teller of the Columbus Laboratories, Chicago. After investigating a month in their baking department the value of Heathization in the making of bread, their findings conclude with this paragraph:

"In conclusion, we find as to results of our experiments and the careful consideration of this subject, that Heathization tends to promote cleanliness and purity of product in the making of bread, and that it does produce an appreciable improvement in the flavor of the finished product."

In 1921 Dr. Victor K. La Mer, Ph. D., of Columbia University, wrote a series of articles for the American Food Journal upon Vitamines. This instructor in Research Chemistry at Columbia University had done much original work in connection with vitamines upon oxidation and reduction potentials. He is the author of "The Effect of Temperature and Hydrogen on Concentration upon the Rate of Destruction of the Antiscorbutic Vitamine." Dr. La Mer has made a more complete investigation of Heathization than any other scientist and his findings are so startling and conclu-

A Milk Shortage is about due

THIS is the time of year when milk may be scarce. But you needn't worry if you use Merrell-Soule Powdered Skimmed Milk.

You can lay in just as big a supply of Powdered Skimmed Milk as you can possibly need, or you can depend on getting more just when you need it. And you can laugh at shortages and strikes.

Powdered Skimmed Milk before water is added will keep for months and months. You add water and have just as much milk as you need anytime.

Its the clean way, "the economical way" to buy milk. No half empty bottles or cans are sitting around drawing flies, wasting profits. No one handles the milk except the manufacturers, whose cleanly care is scientific.

Order from your supply house salesman today.

sive, that readers of The Ice Cream Review will be interested in reading his report which I quote:

"The first test which I made was the determination of the relative amount of expansion energy released during hardening. I leveled off twenty quart cans of both products, each can containing exactly 25 pounds of ice cream. The Heathized can developed over ten times as much weight lifting energy.

"I next conducted a test upon flavor. I had fifteen people try both kinds of ice cream to see which was to them the more pleasing. I gave the samples secret markings known only to myself. The selections were made and twelve out of the fifteen selected the Heathized as preferable, the consensus of opinion being that it was a richer, smoother product, with better flavor. One of the judges was not sure which was preferable. Two selected the ordinary ice cream as their preference.

"Attached hereto you will find the names of the judges with their selections and comments. There is no room for doubt that Heathization improves the flavor of both ice cream and butter when good raw materials are used. I believe the reverse would be true if bad flavored raw materials were used. The stimulating effect of carbon dioxide upon the nerves of smell and taste has long been known to cause the more apparent flavor in carbonated than uncarbonated drinks.

"In my vitamine feeding experiments, I proved my basal diet free from vitamine A, and adequate in other respects, by feeding two rats upon it without any addition of butter. Both rats died upon the forty-ninth day, with marked loss in weight and with typical cases of eropthalmia due to deficiency in Vitamine A. Previous experiments, (fourteen in number) on this same diet have shown that such rats die on the average on the fifty-first day.

"I then fed ten pairs of rats this basal diet plus a supplement of butter, varying between .025 and .600 grams. At the end of three weeks the ten rats receiving the supplement of ordinary air-churned butter gained an aggregate of 466 grams while the ten receiving the Heathized butter, (made from the same cream) gained 534 grams, or an advantage of 15 per cent.

"Since there were two more males on the Heathized butter and two more females on the ordinary butter, I should make a correction for the greater growth in the males. Allowing fourteen grams per cage per three weeks, or 0.7 gram per day per rat, the data still shows that all of the rats gained 8.6 per cent more on the Heathized than on the ordinary, (on the average) as might be expected from other work on the vitamine destructive action of the oxygen of air.

"Only one pair of the ten pairs received a bare weight maintenance requirements **from the start of the butter additions,** so that the results of this test are of especial interest. These two, and an extra available rat, were of the same sex and litter, and of the same condition and size (within one seventh of an ounce). At the end of the two weeks feeding with a butter supplement of only .025 grams daily, the rat fed ordinary butter had gained 0.214 grams per day; one rat fed Heathized butter gained 1.78 grams per day (25 grams in 14 days), and the other rat fed Heathized butter gained 1.43 grams per day (20 grams in 14 days). The average daily gain for the two rats fed Heathized butter was therefore 1.60 grams against 0.21 for the air-churned or nearly a ratio of eight to one, but the rat fed the air-churned butter showed unmistakable signs of sickness, so have just switched him on to the Heathized butter supplement to make certain of the cause. He has made a gain of fifteen grams in the last 11 days on Heathized butter (see accompanying curve). I am now going to switch him back on to ordinary butter to confirm the result.

"Such well known vitamine experts as Profs. Hopkins, Drummond, Hess, and Dutcher are agreed that oxidation (by air) will destroy the A and C vitamines. The writer has shown previously in connection with other work that the C vitamine was completely destroyed by boiling with pure oxygen. Zilva's experiments show that carbon dioxide instead of oxygen prevented this destruction. McClendon's work gave similar results.

"My bacteriological examination is not yet started. However, I have received from Dr. G. W. Lougheed, of the Department of Pathology, Toronto General Hospital, his counts upon five ordinary and five Heathized samples of butter made from split batches of cream. His report showed a reduction in every instance in favor of the Heathized butter—the average bacterial contents of Heathized butter being less than one third as much as in the ordinary butter made from the same cream.

"Prucha, one of the authors of Circular 256, University of Illinois, shows clearly under Experiment 3 how valuable carbon dioxide is from a bacteriological standpoint. Of twenty different cultures (two being pathogenic) that could grow in air, only two could grow in carbon dioxide, due to its inhibiting action. Seventeen were not killed, but the three that were killed included the two pathogenic types (disease germs). However, this circular while it refers to the bacterial clusters breaking up (experiment 2) due to agitation in the freezer, it does not show the further breaking up of bacterial clusters that might be due to the carbon dioxide itself.

"My investigation, while not yet completed, shows that Heathization is scientifically sound and a decided step forward in the sanitary handling of food. Air contains impurities (dust particles, fungoids, bacteria) making it undesirable in food from the standpoints of cleanliness and purity. In fact in many states there are laws prohibiting the direct exposure of foodstuffs to air for this reason. Besides this the presence of air sets up oxidative reactions that are destructive to flavor and vitamines, a point that is just beginning to be appreciated.

"Carbon dioxide, being of greater purity and cleanliness than air, should result in cleaner food products. Containing no free oxygen, it does not contribute to deterioration of flavor, and the diminishing of the vitamine content as air has been shown to do.

"Furthermore, while air fosters bacterial growth in general carbon dioxide is often an inhibitor; the B. Typhosus being especially sensitive to its destructive action, as stated by Rideal in his book on Disinfection and Disinfectants (The Sanitary Publishing Company, London).

"I am not interested in the commercial value of your process of Heathization, but certainly from a scientific standpoint it has a great deal to recommend it, and as far as I can see it would be difficult to conceive of any valid objection to its use."

Here we have five impartial investigations from institutions of the highest standing, all proving the practical and scientific value of Heathization. There are no other authoritative investigations upon the Heathization of ice cream, past or present, conducted in any plant licensed to Heathize; no other investigations can

"THEY CAN BECAUSE THEY THINK THEY CAN."—VIRGIL.

be accepted as authoritative. Miscellaneous reports similar to the University of Illinois circular may appear from time to time showing certain results under varying conditions, but such findings are not indicative of the value of Heathization as employed in licensees' plants. The proof lies in the difference in the results obtained under the Heath method and the chance method of the inexperienced.

The well known beneficial properties of carbon dioxide have prompted many scientists to experiment with it in laboratories. The intention and sincerity of these investigators may be unassailable; their motives may be beyond suspicion, yet you could not judge Heathization by their findings any more than you would expect to judge the merits of a homogenizer by examining dairy products that had been put through an emulsifier. You might say both distribute the fat globules, yet the two products are very different.

Because Heathization applies to food products so colossal in their scope, food products for which the American people spend annually two thousand million dollars, this inovation has inspired commendatory articles and editorials in numerous periodicals of serious purpose. The Literary Digest regarded this new science of such importance as to devote a whole page to the description of its claims. The New York Tribune featured it in their editorial page. Woman's and home magazines have endorsed Heathization; and it has been generously written up in a great number of the leading American and Canadian hospital, medical and health magazines.

The scientific reasons why Heathization is desirable are so apparent that leading scientists unhesitatingly endorse it. From a large number of them I will submit only one in conclusion. There is perhaps no greater authority upon air and its dangers than Dr. Jacques W. Redway, F.R.G.S., of the Meteorological Laboratories, Mount Vernon, New York. He is the author of the United States Department of Interior Bulletin entitled "The Dust Problem in School Buildings," also of "City Street Dust and Infectious Diseases" (January 1922 Ecology), and articles in the Medical Times.

Dr. Redway states:

'The flying dust at the earth's surface is a menace to health that musa be ranked with noxious insects and contaminated water—Clean air, which mortals never breathe, rarely contains fewer than three thousand visible dust particles per cubic inch.

"Health finds that an atmosphere of carbon dioxide is effective in preventing oxidation. The investigations of the Department of Agriculture leave no doubt about the value of a process which excludes free oxygen. Carbon dioxide is a pleasant stomachic stimulant and its consumption in aerated beverages is increasing. Indeed, humanity drinks millions and millions of gallons of aerated waters daily during the summer months, not "for the sirups but for the refreshing effects of the carbon dioxide. It therefore should be as acceptable in butter and ice cream as in the so-called soda water.

"Butter fat is by far the most important of the food fats, and its importance is due to its vitamine content. If the presence of carbon dioxide will preserve the vitamines, that fact alone is sufficient reason for its employment."

"There is neither chemical nor medicinal action in its use; it merely expels the air which contains the causes of deterioration; and no matter what the economical features of the process may be, **one thing is certain: It is in the interest of public health."**

Yours truly,
W. P. HEATH.

PENNSYLVANIA STATE ICE CREAM MANUFACTURERS TO HOLD ANNUAL CONVENTION.

These are busy days for the officers and committee members of the Association of Ice Cream Manufacturers of Pennsylvania. They are getting ready for their sixteenth annual convention, which will be held at Harrisburg, Pa., October 9th, 10th and 11th, with headquarters at the Penn-Harris hotel. Mr. J. W. Neuman is secretary of this association. It looks as if there is going to be some heavy stuff pulled in the way of furnishing business stimulation to members—and leave it to Neuman not to forget that conventions aren't all work and no play! Not being a dull boy himself, he doesn't want anybody else to get that way, therefore the prospect for interesting amusement looks pretty good. Members had better turn to their calendars and put a ring around those three dates now, also to play safe on hotel accommodations by making reservations now.

TWO SUGAR MEN CALL.

Two hustling representatives of The Franklin Sugar Refining Company, Philadelphia, graced the Ice Cream Review sanctum one afternoon recently, and we are indebted to them for an interesting dissertation on the production and manufacture of that which satisfies the world's sweet tooth. Mr. C. W. Nordland, of Philadelphia, and Mr. Karl Pierson, Milwaukee, were the gentlemen in question and what they know about sugar would make a big book. It is indeed gratifying to note the special interest that sugar manufacturers are taking in ice cream manufacture. Special sugars for the industry are the result.

If you are tired of your business, don't worry over it. Advertise it for sale in The Ice Cream Review Want Department.

MANUFACTURERS AND DEALERS IN
Creamery, Dairy, Ice Cream Machinery

PROF. BAER'S INQUIRY DEPARTMENT

Reply to Z. R. T.: I have your recent letter in which you stated that you have trouble with sandy and gritty texture in your ice cream.

I have analyzed your mix and you will find the calculations given in table one.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
160 gal or 1328.0 pounds, 22 per cent cream	292.16	92.21	384.37
80 gal or 792.0 lbs. 8 % condensed	63.36	142.56	205.92
50 gal or 430.0 lbs. 3.5% milk	15.05	36.94	51.99
12 gal or 99.6 lbs. water	....	....	....
12.0 lbs. gelatine	....	....	11.40
300.0 lbs. sugar	....	....	285.00
2961.6 lbs	370.57	271.71	938.68
Per cent	12.5	9.18	31.7
Per cent sugar 10 per cent			

You will notice that while you have 12 per cent fat and 9 per cent serum solids your total solids are very low due mainly to the fact that your mix contains only 10 per cent sugar. I have taken for granted that your condensed milk is an unsweetened product as you did not state whether or not this contained any sugar.

It appears to me that the sandy or gritty condition of your cream must be due to the large amount of condensed milk. It is also possible that your condensed milk is held for quite a while at a very low temperature which is the cause of the candy product.

If you will give me a little more detail relative to your condensed milk, I can possibly find your trouble a little better.

I can not understand why after pasteurizing and viscolizing you should find lumps of gelatine in your mix unless you add your gelatine after pasteurizing instead of before. I suggest that you try adding your gelatine with the sugar into your hot mix while pasteurizing and thus eliminating the cooking of the gelatine in the same cooker.

* * *

Dear Sir:—Received your valued reply and am very much pleased with the results I am getting.

I would also desire a formula for making unsweetened condensed milk, from butter, skim milk powder and water having about 8 per cent fat.

To what temperature would you heat these ingredients, and how long would you hold at said temperature before running it through the homogenizer. G. M.

Reply: I am glad to suggest that you could make up an unsweetened condensed milk using the following ingredients:

9.5 pounds butter; 27.0 pounds skim powder; 63.5 pounds water; 100.0 pounds condensed—8 per cent fat 26 per cent serum solids—34 per cent total solids.

I suggest that the entire mix be heated at least to the pasteurizing temperature of 145 degrees and held at least 30 minutes before running it through the homogenizer.

* * *

Dear Sir:—We are planning to install a Manton-Gaulin Homogenizer, are also going to change our formula. We wish to have one formula:

For 100 pound mix, 15 per cent cream, skimmilk powder, gelatine, sugar, vanilla, 4 dozen eggs.

Please tell us the quantities of these ingredients that will give the best results. We intend to pasteurize the entire mix, at a temperature of 145 degrees homogenize, cool to 40 degrees and age. We would like to have the finished product to test at least 14½ per cent butterfat.

Please figure a second formula using 3¼ per cent milk, 85% sweet butter in place of 15 per cent cream. O. B. S.

Reply: You will find calculations made below in table 1 and table 2. You will notice however that in table 1 it has included 4 pounds of butter in order to make up the amount of butterfat which could not be furnished by the 15 per cent cream alone.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	....	....	13.30
.3 lbs. gelatine	....	....	.28
2.0 lbs. Skim powder	....	1.9	1.90
6.0 lbs. eggs	....	....	1.20
4.0 lbs 85% butter	3.4	....	3.40
73.7 lbs 15% cream	11.05	5.58	16.63
100.0 lbs.	14.45	7.48	36.71

Table No. 2.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs sugar	....	....	13.30
.3 lbs. gelatine	....	....	.28
2.0 lbs skim powder	....	1.9	1.90
6.0 lbs eggs	....	....	1.20
15.0 lbs. 85% butter	12.7	....	12.70
62.7 lbs 3.25% milk	2.03	5.4	7.43
100.0 lbs.	14.73	7.3	36.81

* * *

Dear Sir:—Will you please give me a formula, for a 10 per cent ice cream mix, with 35 per cent solids.

I want to use, 20 per cent sweet cream, 3.5 per cent milk, and skim condensed, I use nothing but pure cane sugar for sweetening, and no filler of any kind, only the best gelatine I can buy, for flavoring I use 4 oz. vanilla.

I am really trying to give the people a real ice cream and do not believe in a lot of dope, so give me the best formula you can.

Will you also advise me how many pounds of butter you would have to add to 3.5 per cent milk to make a 20 per cent cream. R. D. P. Co.

Reply I am glad to suggest below in Table 1 an ice cream formula with 10 per cent butterfat and 3 per cent total solids, made up from the ingredients mentioned in your letter.

Replying to the matter of making up 20 per cent cream from butter and 3.5 per cent milk. You would use 16½ pounds with 64 pounds of 3.5 milk. Those figures are arrived at by substracting 3.5 from 20, getting 16½, or the amount of butter you use in subtracting 20 from 84, which is the per cent of fat in unsalted butter, giving 64 pounds or the amount of milk with 16½ pounds of butter. This would make a total of 80½

100.0 lbs.	10.0	9.54	33.38

* * *

Dear Sir:—We are sending you two of our mixes and would like to have your comment on them, also any suggestions you might offer to improve our mix. Would like to know the total solids of each mix and the changes necessary to give us the proper solids. Also the amount of ice cream we should get from each one.

We have not been getting the proper overrun and thought it might be caused from lack of solids.

We are making a 14 per cent cream and assure you that any information you give us will be greatly appreciated.

Mix no. 1—320 lbs. 30 per cent emulsified cream; 320 pounds 35 per cent milk; 112 pounds sugar; 20 pounds gelatine and water; 3 pounds vanilla. total 775.

Mix No. 2—Butter 84 per cent fat 101.4; milk 3.5 per cent fat, 548.6; sugar, 112.0; gelatine, 5.0; vanilla, 3.0. Total 770.0. G. R.

Reply: You will find the analysis of your 2 tables given below in Table 1 and 2. I do not know whether you have ever tried the use of skim milk powder for the purpose of increasing the milk serum solids, but I believe you could improve your cream consistency if you would use just a little less sugar, possibly 13½ per cent and increase the serum solids by 2 per cent.

I shall be very glad to assist you further in these if you desire to use skimmilk powder and are not sure about the mixes.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
320.0 lbs. 30% cream	96.0	19.94	115.94
320.0 3½% milk	11.2	27.50	38.70

* * *

Dear Sir:—A friend of mine, superintendent of an ice cream plant, and subscriber to the Ice Cream Review, has asked me to write you for suggestions regarding his mix. He believes he should have more solids in the cream and would appreciate your criticism of the formula, with suggestions for its improvement.

Following is the mix:

250 quarts or 3.5 per cent milk; 100 quarts or 38 per cent to 40 per cent cream; 50 quarts condensed whole milk 3.5 per cent—2 to 1 "Ruff" machine; 3½ pounds gelatine; 125 pounds of sugar. P. L.

Reply: You will find in Table number 1 the analysis of the present formula and I am also suggesting in Table number 2 how you could have double the amount of condensed milk, improving your mixes by increasing the serum solids and total solids.

If you have any further conversation relative to my suggestions or if you should desire, I shall be glad to have you write.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
250 qts. or 537.5 lbs 3.5% milk.	18.81	46.23	65.04
100 qts. or 200.0 lbs. 4.0% cream	80.00	10.68	90.68

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. Sugar	....	....	13.30
.5 lbs. Gelatine	....	....	.47
50.0 lbs 8% condensed	4.0	9.0	13.00
20.0 lbs 40% cream	8.0	....	9.06
15.5 lbs water	....	1.06	....
100.0 lbs.	12.0	10.06	35.83

* * *

Dear Sir:—Will you please send me a formula for 100 gallons raw material or 200 gallons finished ice cream of 10 per cent butter fat, 34 per cent total solids using 3½ per cent milk, 84 per cent butter and skim milk powder also a formula for 100 gallons raw material or 200 gallons finished ice cream of 14 per cent butter fat, 36 per cent total solids, using same ingredients as above. P. A. M.

Reply I am suggesting a 10 per cent and a 14 per cent ice cream mix with the ingredients suggested in your letter.

You will notice that both of these mixes are for 900 pounds so that if your ice cream weighs 4½ pounds to the gallon having overrun and 100 per cent, that it should yield 200 gallons of ice cream.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
126.0 lbs. sugar	....	....	119.70
4.5 lbs. gelatine	....	....	4.27
36.0 lbs skim powder	....	34.2	34.20
80.0 lbs 84% butter	67.2	....	67.20
653.5 lbs. 3.5% milk	22.83	56.2	79.03
900.0 lbs.	90.03	90.4	304.40
Per cent	10.0	10.0	33.80
Per cent sugar	14.0	....	....

Table No. 2.

Ingredients	Fat	Serum Sol.	Total Sol.
126.0 lbs. sugar	....	....	119.70
4.5 lbs. gelatine	....	....	4.27
28.0 lbs skim powder	....	26.6	26.60
124.0 lbs 84% butter	104.16	....	104.16
617.5 lbs. 3½% milk	21.60	53.05	74.65
900.0 lbs.	125.76	79.65	329.38
Per cent	13.97	8.85	36.59

Who Said It?

EVERYBODY'S SAYING THE

"Goody Good" Plan is helping their Ice Cream business. No new equipment — No royalties.

Ask **SANI-DAIRY PRODUCTS CORPORATION**

45th and Evans Ave. Chicago

Dear Sir:—I would be pleased if you would let me know my serum solids, butterfat and total solids. At present we are using 90 gallons 3.5 per cent milk, 30 gallon 8 per cent bulk condensed, 124 pounds butter 84 per cent, 150 pounds sugar, 7 pounds gelatine, 10 ounces meloine, 6 ounces concentrated vanilla, and 4 ounces color.

If you could suggest any changes would like to have you do so. I viscolize my whole mix and obtain about 240 gallons of finished cream.

I am enclosing a stamped envelope and would very much appreciate a letter in reply. F. H. S. & S

Reply: Replying to your letter of March 29, I am glad to figure your fat, serum solids and total solids. You will notice that you have a total milk solid of just about 20 per cent which is as low as a good ice cream should have. You could improve this formula by using just a little more serum solids. You could easily do this by using a little skimmilk powder. You will also notice that you have only 31½ per cent solids. This is due to the small amount of sugar. Most ice cream factories now use 13 to 14 per cent sugar while you notice that you only have 11.3 per cent.

I believe with these suggestions you will be able to modify your mix and get better results. You should be able to get more than 240 gallons of ice cream from this mix. If you will increase the total solids to 35 per cent you should have no difficulty in getting close to 300 gallons from your mix.

Ingredients	Fat	Serum Sol.	Total Sol.
90 gal. or 774.0 lbs. 3.5% milk	27.09	66.49	93.58
30 gal. or 264.0 lbs. 8% cond...	21.12	47.52	68.64
124.0 lbs. 8.4% butter	104.16	....	104.16
150.0 lbs sugar	....	....	142.50
7.0 lbs gelatine	....	....	6.65
1.25 lbs. van and color	....	....	.19
1320 lbs.	152.37	114.01	415.72
Per cent	11.53	8.69	31.5
Per cent sugar	11.3	....	....

* * *

Dear Sir:—We are anxious to have you figure a thousand pound mix for us with 38 per cent solids, 12 per cent butterfat. We use skimmilk, unsalted butter and skimmilk powder but our results are not satisfactory, the ice cream being too rough.

If possible we would like to use skimmilk powder with condensed skimmilk to obtain the correct amount of solids. S. F.

Reply: I am glad to suggest the ingredients for the 1000 pound mix as suggested in your letter.

1000 lb. Mix, 12% fat, 38% Total Solids

Ingredients	Fat	Serum Sol.	Total Sol.
140.0 lbs sugar	....	....	133.00
5.0 lbs. gelatine	....	....	4.75
143.0 lbs 84% butter	120.12	....	120.12
100.0 lbs skim condensed	....	30.	30.00
44.0 lbs skim powder	....	41.8	41.80
568.0 lbs. skim milk	....	50.56	50.56
1000.0 lbs.	120.12	122.36	380.23
Per cent	12.01	12.22	38.02

You do not state in your letter the per cent of sugar that you desired, but I am assuming that if you want 38 per cent solids that you would want to use at least 14 per cent sugar.

You can't afford to miss a single copy of "The Ice Cream Review." Did you send in your renewal?

No New Equipment

is required, no royalties, practically no expense is involved—yet a "Plan" to make small customers into large and profitable ones has been successfully inaugurated in many large, as well as small ice cream plants.

The manufacturer who deliberately closes his eyes to the enormous possibilities with the new "no cost" merchandising, selling and advertising campaign that is included with the **"Goody-Good" Plan** is doing himself serious injury.

There is no chance of loss with this plan — you risk nothing.

Experts who have specialized in, and studied ice cream sales, marvel at the rapidity of results and the quick accumulation of profits thru the **"Goody-Good" Plan.**

This in no way interferes with your regular advertising, selling or manufacturing.

The progressive, wide-awake manufacturers will be quick to take advantage of this "Plan."

VANILLA CONTROL

STANDARD VANILLA AND BLENDS

IN every highly specialized industry the laboratory plays an important part. The laboratory makes possible exact buying and manufacturing, without which the highly specialized business does not prosper.

Just consider the importance of the laboratory in the ice cream industry. Crude materials are bought on comparative tests, milk components are bought on a definite fat-and-solids basis and the finished product has a fixed overrun and fat-and-solids composition. Nothing is left to chance. And only by such methods as this is it possible to strike a favorable balance at the close of the year.

Our business, just as highly specialized, if not more so, demands the same control. Crude materials are bought, subject to laboratory approval, processes are checked, and finally, the finished product is analyzed for constancy of composition. And just as the ice cream manufacturer by such methods gives fair value to the public so do we guarantee our products to the manufacturer at all times.

SHIPPERS OF CREAM, MILK AND EGGS
MILTON, PENNA.

John J. Grothe Co., Aug., 21st.
Woburn, Mass.

Gentlemen:

Just a little Booster letter—We are operating two Grothe Body trucks and we want two more in the very near future and possibly two in the spring. Why?—Saturday, Aug. 19, our 200 gallon Body loaded to capacity was forced over an embankment thirty miles from plant, and in the turn over about half the ice from the refrigerating compartment was lost and body landed on door side. Twelve hours later truck and body was brought back to the road, AND 200 GALLONS OF ICE CREAM was found to be in the same condition as it left the plant. Lying 12 hours in the hottest sun we have had this summer (108 Temp.), with half the amount of ice, we believe is as hard a test as a body can be put to. The truck, a Kearns and body, carried on with only a few scratches to show. Both showed a splendid work of efficiency and sturdiness.

Kindly send us your new folder, as we desire to place with the Kearns Motor Co. our order for two more Grothe Body trucks.

With our very best regards and appreciation,

Very truly,
PLEASANT VALLEY CREAMERY CO.,
Per Sec. and Mgr.,

GREAT BUFFALO SHOW OUTMATCHED.

(Continued from page 10)

of such new types and varieties of equipment and machinery as have been developed in the past year.

More Booths.

At Buffalo there were a little more than 20,000 square feet of space in the exposition building, the attractive Elmwood Music Hall. In the Cleveland Public Hall the exposition space to be occupied by the National Exposition exceeds 30,000 square feet.

There will be a corespondingly greater number of booths than there were at Buffalo, and therefore a wider variety of equipment, machinery, supplies and special services as well as a greater number of examples of each variety, on display.

Ice cream manufacturers traveling from any distance were able to meet nearly a thousand of their fellow manufacturers from other cities and states at Buffalo.

At Cleveland they will be able to meet more nearly 2,000 than 1,000 fellow manufacturers.

At Buffalo the exposition building was about ten minutes' distance from the principal hotels.

In Cleveland the Exposition will be two minutes' leisurely walk, only, from the hotel headquarters of ice cream manufacturers.

Some Displays.

Freezers, tanks, mixers, homogenizers, ice making machinery, breakers, condensers, and other pieces of machinery were among the displays at Buffalo.

More than fifty varieties of essential supplies ranging all the way from colors to milk, from flavors to cartons, from salt to improvers, were also on display.

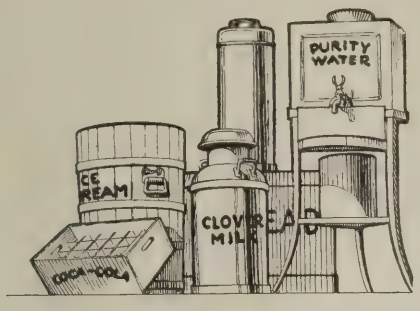
Delivery, packaging, refrigeration, interior and exterior plant equipment—in fact every general or special type of equipment, used in connection with an ice cream business, was also represented on the floor.

Some of the special services employed by ice cream manufacturers to advantage that were displayed or demonstrated were merchandising, engineering, laboratory, accounting, advertising and repairing services.

Leaders There.

The various companies making displays included the leaders in every line of industry serving the ice cream business in its supply end. Many of the displays were valued at tens of thousands of dollars. Many of the goods shown were made up specially for the exposition and represented months of special effort and expense.

The visitors came from Colorado, Connecticut, District of Columbia, Illinois, Indiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, New Hampshire, New York, New Jersey, Ohio, Pennsylvania, Rhode Island, Vermont, West Virginia, Wisconsin and from the following Canadian provinces: New Brunswick, Nova Scotia, Ontario and Quebec.



The details of the exposition were carefully worked on for months by The Association of Ice Cream Supply Men.—Exposition Extra.

If you want a manager, superintendent, expert, chemist, bacteriologist, operator, pasteurizer man, or help of any kind, "The Ice Cream Review" can help you find the best available man. If you want a position, "The Ice Cream Review" can help you as it has helped hundreds of others to secure a good position.

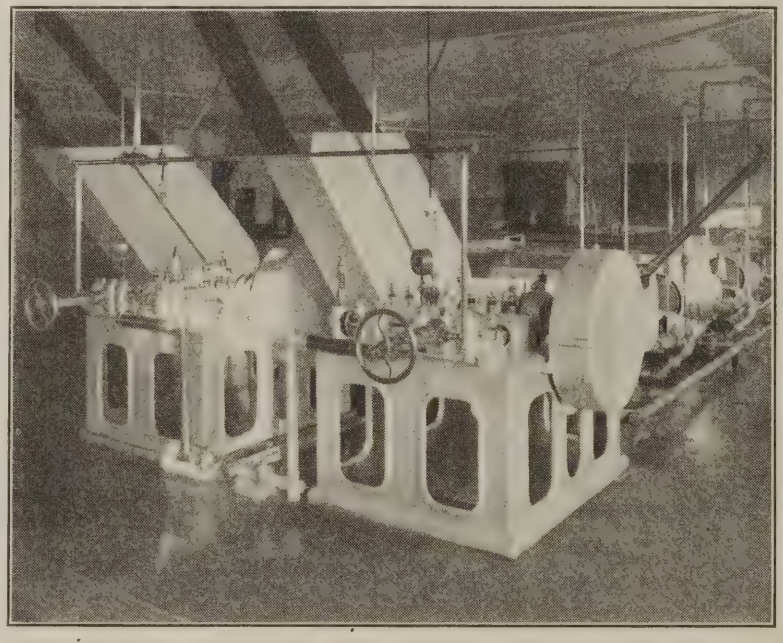
Industrial Philadelphia—Philadelphia Ice Cream



THE Girard Trust Company, Philadelphia, issues an interesting monthly house organ entitled "The Girard Letter." In the July issue there appeared an article devoted to "Industrial Philadelphia," and which featured the ice cream business of the city. We are privileged to reproduce this splendid article as follows:

America's national holiday was fixed for all time in Independence Hall, Philadelphia, on the Fourth of July, 1776. From the modest home of Betsy Ross in Arch Street, Philadelphia, came the country's national emblem, the Stars and Stripes.

We have our national song, and baseball is labeled the American national sport. The eagle is the national bird, while the turkey is undoubtedly the typically American fowl and corn the great cereal peculiar to our country.

Ice cream is distinctly a United States product, and Philadelphia ice cream is a recognized standard for the rest of the world. Ice cream is unquestionably the premier dessert or confection on this continent. Tens of thousands of immigrants annually come to our shores who never before landing had heard of ice cream.

There have been many guesses about who invented ice cream. Centuries ago in India they had learned how to freeze ice in a temperature of nearly 100 degrees above zero by a crude process of evaporation. Perhaps the servant of some Indian Rajah, aspiring to serve his royal master with a new and delectable treat, froze the first ice cream from goat's milk.

The Homogenizer Through Which the Cream Passes on its Way to the Freezers.

James Watson, that indefatigable antiquarian, whose records of early Philadelphia deal with so many important as well as trivial things of past centuries, leaves the inference that a Mr. Segur sold the first ice cream in this city at his shop in Market Street, between Third and Fourth Streets. That was early in the last century.

Until long after the Revolution there was not even a central ice plant, but each citizen who wanted ice in summer had to store it for himself. The first ice dealer was Henry Moliere, and he was regarded as a reckless business adventurer.

But whether the first ice cream, as some have contended, was served to an old English King, or whether it was an ingenious American who invented it is of no concern here when compared with the outstanding facts about ice cream today which are these:

Philadelphia has the largest manufacturer and distributor of ice cream in the world.

Philadelphia ice cream is far more widely sold than that from any other city.

Philadelphia ice cream is less expensive than in other comes along with the Fourth of July, but one day in great cities but is is everywhere held up as the standard of excellence.

* * *

The making and selling of ice cream has grown into a big industry in this city. There are five large firms which manufacture what may be styled the ice cream of commerce.

The Breyer Ice Cream Company, of which Henry W. Breyer is President and virtually owner, is not only the largest in Philadelphia but in the world. It was that company's plant which was selected for the purposes of this article to typify this ever-growing enterprise so peculiarly connected with Philadelphia.

The amount of ice cream made in Philadelphia is almost unbelieveably great. Right now the average produced by the five commercial plants — Breyer, Abbott, Supplee, Colonial and Crane—is close to 350,000 quarts a day, of which Breyer makes about one-third.

The peak for ice cream output and consumption June Breyer sent out 162,000 quarts.

Good as the Philadelphia brand of ice cream is Philadelphians do not eat all that is made in this city.

Swift auto-trucks every day carry to New York alone from 20,000 to 40,000 quarts of Breyer's ice cream.

More than 500 other towns scattered between Bridgeport, Connecticut, on the North, Cape Charles, Virginia, on the South, and as far inland as Chambersburg, Pennsylvania, and Atlantic City and Asbury Park on the East, are regular customers of this firm.

Of every 100 quarts of ice cream made by Breyers, 60 are eaten in Philadelphia and 40 by persons in other places—a sound tribute to the excellence of this Quaker City product.

* * *

So far as known, nobody from any other city sells ice cream to Philadelphia. But in scores of restaurants, drug stores and hotels scattered along the Atlantic Coast for three hundred miles, Philadelphia ice cream is regularly served, although not always labeled as such.

Breyer will not serve less than 100 quarts of ice cream a week to any dealer, thereby guaranteeing fresh cream to the public.

Upon the walls of the office of the Company's sales manager hangs a detailed map of this city. It is thickly dotted like a war-map with different colored pins, each color denoting a particular thing.

A pin represents one of the 2000 customers, who must each day be visited by a Breyer ice cream truck, whether or not a new supply is needed.

ASK ANY FOOD CONTROL OFFICIAL ABOUT DELFT

Delft standards of purity, uniformity and strength are recognized and praised by Food Control Officials.

Before Delft entered the field, who ever heard of gelatine supplied in quantity lots, free from liquefying and harmful bacteria when delivered? Gelatine that is free from liquefying and harmful bacteria is a highly sanitary product.

Get your friendly competitor to tell you about the splendid results obtained from Delft.

Delft is strictly a TOP QUALITY gelatine, sold at reasonable figures, that represent exceptional value. Because of its purity and strength, it goes further than cheap gelatines, and actually costs you less.

You can get the same price from our distributors as from us.

MEMBER

Harold A. Sinclair

A GOOD BEGINNING IS HALF THE BUSINESS.

(Continued from page 130)

The Breyer Company supplies all the ice which the individual dealer requires to preserve his cream.

The amount of ice is so vast that the Breyer Company has installed a mechanical method of packing ice cream cans in the vehicles for delivery. The cracked ice and salt are shot down upon the tops of the filled cans after they have been placed upon the trucks.

To meet the immense demand for ice the Breyer Company every day manufactures over 300 tons.

Salt is another factor which runs into heavy figures, the amount used being about 100 tons daily. And none of this ice and salt goes into the manufacture of ice cream but only in its delivery or sale.

Ice cream is not frozen with ice but with a brine just as ice itself is frozen.

* * *

Henry W. Breyer's father began to make ice cream up in Kensington just after the Civil War. At first he sold what he made in one small shop.

Afterwards the father branched out a bit and established other ice cream stores, but it was not until after 1907 when the Breyer Ice Cream Company was incorporated with the son, Henry W. Breyer, virtually the sole owner and President, that this plant began to enter largely into the ice cream trade of Philadelphia.

Mrs. Breyer is Vice-President of the Company and Wilbur S. Scott is Secretary and Treasurer. The company's buildings at Cumberland and Ninth streets occupy an entire block and new additions go up with great regularity.

A Row of Ice Cream Freezers, Each with a Capacity of 100 Quarts.

But after all the things which most interests the public is not the size of the plant, not the distribution of its immense product, but the actual making of ice cream on this tremendous scale.

Cream is the first essential and Breyer owns four creameries in Juniata and one in Berks County, and purchases the complete output of several others. One of the creameries in Juniata is probably the largest in the state. From these there come steadily to the Philadelphia plant the carloads of carefully inspected cream.

And the Philadelphia ice cream of commerce which has now such wide fame, must be made of real cream. The cream is not only rich, it is also clean and is kept so through the entire process.

The cream which is chemically tested in a laboratory must have from 11 to 12 per cent of butterfat after it is pasteurized and cooled by falling over a series of artificially cooled rolls.

* * *

To manufacture from 100,000 to 150,000 quarts of ice cream daily, requires a steady flood of cream, but it also requires some 400 barrels of sugar every week, 450 pounds of vanilla bean, 2200 bushels of peaches, 500 boxes of oranges, 9400 pounds of chocolate, 60,000 pounds of strawberries per week.

All the fruit used is carefully sorted and the defective is discarded. A score of men and women at the present time work constantly at Breyer's to prepare the peaches needed for that brand of ice cream, the peach season having now succeeded the strawberry.

Orange juice alone is used in flavoring water ice, the rind, pulp and seeds of the orange being removed mechanically.

The cream is standardized on an upper floor and then run through the Homogenizer, which is a curious machine for the breaking up of all particles of fat by placing the cream under tremendous pressure, thus making it thoroughly homogeneous, hence the name of the machine. It then runs by gravity through sanitary piping to large tanks, holding one thousand gallons each. Sugar is mixed in at this point, and the cream again flows by gravity to ice cream machines on the first floor where the flavoring is added.

The actual freezing of the ice cream at Breyer's is a quick process. There are 30 machines each holding 100 quarts for the bulk and 8 of 40 quarts each for the manufacture of brick ice cream.

Around the can in which the cream is securely locked, is a layer of brine. The paddles are rapidly revolved, while the cream is thoroughly stirred. It takes but fifteen minutes to finish the freezing.

But the ice cream is not yet ready for the consumer. When taken from the freezer it is still soft enough to be poured.

It is then put in cans, and stood in a cooler which is a real cold storage plant, because the temperature is kept at from zero to five degrees below. The cans remain in storage a day and are then ready to yield their contents to the waiting public.

* * *

The Breyer plant employs about 500 persons. Instead of tea in mid-afternoon, as the English custom is, the Breyer force stop to eat ice cream.

Fifteen men are needed at the Company's telephone exchange all night every night to take orders. The sales force in that plant is a live outfit but it is hardly more competent than the purchasing department upon which after all depends the quality of the finished product.

A visitor to this unique factory, from which flows so much human joy, comes away with several definite and deep impressions.

First, Breyer's ice cream is clean. Second, it is wholesome. Third, it is made of nothing but excellent materials and no substitutes. Fourth, it has things done to better it, which no home-made article can possibly get.

The lowness of the wholesale price is rather astonishing when it is also remembered that these ice cream producers of Philadelphia have made it so well that it long ago gained, and has ever since held, the coveted brand of standard.

Reprint from the July number of the Girard Letter, issued by Girard Trust Co., Philadelphia, Pa.

Quality

Quality in ice cream is beneath the surface—where the eye can't see it and where only use can prove it.

Efficiency in a cleaner likewise is not a visible quality, but is the product of its use.

The shrewdest buyers among ice cream manufacturers have for many years standardized the use of

Wyandotte Sanitary Cleaner and Cleanser

for all cleaning in their plants because they have always found the sweet, wholesome, sanitary cleanliness it provides efficient, profitable and economical.

New $80,000.00 Factory for Manufacture of Dairy Machinery

Large Addition to North Chicago Factory of Davis-Watkins Dairymen's Manufacturing Company.
Has Unique Water Sealed Roof.

Rapid expansion in the business of the Davis-Watkins Dairymen's Manufacturing Company, well known dairy equipment manufacturers, has made necessary a large addition to their North Chicago factory.

This new addition is to be 160 feet long by 120 feet in width adjoining the main plant on the south. It will be of concrete and glass and will be the last word in modern factory construction.

Work on the new structure is being done by the Rolff Construction Company of Milwaukee. Under the terms of the contract, the new addition is to be completed inside of sixty days. Its cost will be approximately eighty thousand dollars.

Since spring, the North Chicago factory has been badly congested and the additional 75 to 100 per cent floor space which the new addition makes available will greatly facilitate the work of the various departments under the supervision of I. R. Hippenmeyer, plant superintendent.

At the present time, the North Chicago factory of the company has about two hundred employees. As soon as the new addition is completed, seventy-five to one hundred additional employees will be added.

A water sealed roof for cooling of the plant is a unique feature of the new addition. The roof is so constructed that it will carry a 4-inch sheet of water during the summer months. Experience has shown that a water protected roof keeps a plant very much cooler in the summer. It absorbs the direct heat from the sun's rays and thereby maintains a comfortable temperature with-

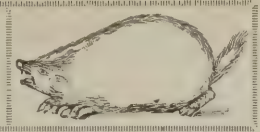
in the plant for the workman. The water sealed feature also makes the construction more fireproof.

When completed, the new structure will help to speed up manufacturing facilities and enable the company to give quicker deliveries on milk plant, ice cream plant and creamery plant machinery from its various sales branches. In addition to their North Chicago factory illustrated here the company has three other factories, one at Jersey City, ont at Derby, Connecticut, and one at Owatonna, Minnesota.

NEW FIRM TO SELL DAIRY EQUIPMENT IN ENGLAND.

A new firm, to be known as Storer, Rodgers and Hughes, has been formed to do a business in England and nearby territory in importing and selling dairy machinery. The firm will not only handle a complete line of dairy equipment, but will design plants for every branch of the dairy business. The headquarters and main show room of the company will be in London. The firm will feature a complete line of Cherry equipment.

The Personnel of this firm assures the success of the enterprise.



R. D. Hughes, general manager of the Farmers' Dairy Company, Limited, Toronto, Canada, is chairman of the organization. Mr. Hughes, however, will continue in his present position and will act in the capacity of authoritative adviser to the new firm, for which his long experience and close association with the dairy industry especially fits him.

The managing director of the business is Wm. Storer. Mr. Storer will have charge of the sales and all matters pertaining to the technical side of the business. Having had twenty years experience in the dairy business, he is admirably fitted to handle his work. Mr. Storer started out with five years actual practice in handling milk and manufacturing milk products, and for the past ten years he has acted in the capacity of special representative of the J. G. Cherry Company. It has been his duty while in his former position to introduce new equipment to the dairy industries, but his work also involved a great deal of designing and erecting of plants for these industries. While engaged in this work, Mr. Storer also had some experience in designing and equipping plants in England, and he is now well known to the English dairy trade.

The third member of the firm, Frederick Rodgers, has for the past six years, been employed by the Cherry Company as export manager. Mr. Rodgers is thoroughly familiar with the dairy industry in all parts of the world and the numerous practices followed in different countries. His knowledge of the exporting and importing of dairy machinery and wide acquaintance with the dairy trade of England particularly fit him to handle his work with the new organization—that of handling the buying, importing, banking and general detail end of the business.

BADGER FLYERS

H. HAGEN, President
216 Grand Ave.
Eau Claire, Wisconsin
O. E. HARWOOD
Secretary - Treasurer
300 W. Austin Ave.
Chicago, Ill.

Do the rest of you Flyers recognize your fellow member on the right of this picture? It's none other than Hugh J. Krampe, or rather, Captain Hugh J. Krampe, who took charge of the Milwaukee office of the Armstrong Cork and Insulation Company last spring. Looks good in that outfit, doesn't he? That picture nearly caused a riot in this office when the stenog force got hold of it. It was all the editorial department could do to rescue it so we could have a cut made for publication, and give the rest of you folks a look too.

This picture was taken last July at Camp Custer, Battle Creek, Michigan. Captain Krampe is a member

of the Engineers O. R. C., and served his country with the 308th Engineers in France. He is a graduate of the College of Engineering of the University of Cincinnati.

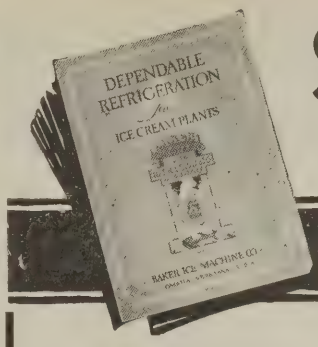
The other two are World War veterans also. The man in the center is Captain Samuel G. Schwartz, Medical O. R. C., a veteran of the Mexican Invasion in 1916. The other is Captain Dorian G. Moon, Engineers O. R. C., a graduate of the London, England, College of Engineering and a veteran of the Boer War in South Africa in 1900. He saw service in France with the 122nd Engineers. Some bunch! It certainly can never be said that Captain Krampe doesn't travel in good company.

HOW TO GET TO CLEVELAND.

Cleveland is an easy city to reach.

It is, almost literally, in the center of things. One-half the population of the United States and Canada is within a radius of 500 miles.

In fact, Cleveland can be reached overnight from either the Atlantic seaboard or the Mississippi River.



There are, for example, eighty three passenger trains—through trains, not local accommodation trains—arriving in Cleveland every day.

Moreover, passenger boats from Detroit and Buffalo and other Great Lake ports arrive daily during the season of navigation at magnificant new piers on the lake front. Combination rail and steamship tickets may be purchased by travelers to Cleveland.

Interurban traction lines radiate from Cleveland in all directions, to Toledo on the West, to Akron, Canton, Columbus and Youngstown on the South and Ashtabula n the East.

Excursions may be made to many interesting and famous resorts in a few hours—to Niagara Falls, Cedar Point, historic Put-in-Bay, Port Stanley, Geneva-on-the-Lake, and the scores of inland lakes near Akron.

Through trains, with finest Pullman standard sleeping cars, are operated daily into Cleveland from Detroit, Chicago, St. Louis, Cincinnati, Pittsburgh, Washington, Baltimore, Philadelphia, New York, Boston, Buffalo, Toronto and many intermediate points, while through sleeping car service is also available during winter months from Atlanta, Birmingham, Chattanooga and Jacksonville.—Exposition Extra.

Refrigeration Facts

To any ice cream manufacturer we will gladly send this booklet. It contains some useful information that you will want to keep, besides showing how the Baker Ice Machine is especially adapted to meet every refrigerating problem of the ice cream manufacturer.

The Baker is a slow speed type, which is a positive guarantee of economical operation. Any man knows that if he races a horse at top speed all the time the horse soon wears out—so it is with an ice machine. Some of the first machines built 17 years ago are still in daily service.

Baker Plants are Cheaper Now Than Before the War

Any manufacturer who does not use mechanical refrigeration absolutely loses money every day in cost of operation.

With the new low prices of the Baker Plants there is no need for any company suffering such loss, especially when a Baker will cut manufacturing costs from 50% to 75% over ice and salt.

We will gladly estimate the cost of installing a Baker in your plant without obligation to you.

Baker Ice Machine Co., Inc., Omaha, Nebr.

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

MICHIGAN
ALLIED
DAIRY ASS'N.

Dairy Booster Officers:
Pres., C. J. YUNKER
1112 Radcliffe Drive,
Toledo, Ohio.
Secy., C. J. W. SMITH
c/o Creamery Package
Mfg. Co., Detroit.

The sad news of the death of Mrs. Howard W. Black, wife of our Vice President Howard W. Black, was received by us and we all extend him our sympathy.

* * *

The Michigan Dairy Boosters is a live organization, it now has over 50 paid members of wide awake firms, who have live wire salesmen. We extend invitations to others to join us. Dues are $10.00 per year.

* * *

Michigan Dairy Boosters will attend the Ice Cream Supply Men's Convention held in Cleveland in October. Everyone should go to it for we are sure it will be a success.

* * *

Well, Booster Olsen, we will soon have to make use of The Ice Cream Review in behalf of Michigan Convention for when we get ready to advertise it, we can use columns of it—we have not forgot your invitation to us to do so. So get ready for it.

* * *

A. B. Carlisle, Port Huron, Mich., is said to be the oldest man in the manufacture of ice cream in the state and by the way he has completed his new plant, and it is said to be the most modern in the state.

* * *

"Hoop" "Hoop" "Horray," let's all watch out for the next Convention to be held in Michigan for it is going to be as good as the last one or much better. For we are going to make it a dandy one as we expect to invite the manufacturers from Ohio, Indiana and Illinois to come to see it. We trust they will be with us, and get acquainted, for that is the way for harmony in business ways—we will show them a dandy show of exhibits, as Michigan Convention is noted for that and Boosters Smoker will be a good one, and you will not regret your trip to our Convention.

* * *

Franklin Creamery Co., Toledo, Ohio, is building a new plant. They are doing a very nice business.

* * *

Field Meyers Ice Cream Company, Battle Creek, Mich., says they are doing fine since they engaged in the business.

* * *

The Sanitary Tinning and Manufacturing Co. of 3753 E. 93rd St., Cleveland, Ohio, is making extensive improvements also installing all new improved machinery to meet the increase of the business coming their way. They are doing business with the largest creameries and Ice Cream Manufacturers as well as smaller firms, they have the reputation of doing good work in retinning cans. They employ 30 men in the factory and will soon increase to 50 men. A. J. Miller, Manager is a hustler and has lots of friends among the trade. He attends the Conventions and his host of friends are always looking for him and his exhibits. Sure we all will enjoy his hospitality while at the Cleveland Convention for he wants the boys to see his Beach on the lake, it is a fine one. When Miller gets his billiard table out there, he surely will enjoy it, at the water breeze. He can play some game especially if he stops laughing for a while. He will spend several thousand dollars in improvements for his tinning plant.

* * *

Frazzell Ice Cream Company, Cleveland, Ohio, reports they are doing a nice business for the short time they have been running.

* * *

All committees and officers of the Michigan Allied Dairy Boosters are getting busy for the next February Convention and it will be a good one, larger and better than ever.

C. J. YUNKER

SANI-DAIRY PRODUCTS CORPORATION
45th and Evans Avenue CHICAGO

NATIONAL DAIRY COUNCIL TO HAVE WONDERFUL EXHIBIT.

Definite relationships between health and the consumption of milk and milk products will be proved in a $10,000 exhibit staged by the National Dairy Exposition under the direction of the National Dairy Council, occupying one of the large show buildings at the Minnesota State Fair grounds October 7 to 14. The exhibit is described as the first of its kind ever shown west of New York. To carry the message of health to the public is its mission.

Fourteen child health organizations and government bureaus are co-operating in the exhibit, which comprises an acre of buildings especially constructed for it in New York under expert direction, together with a miniature railroad with fourteen different stops or stations. Visitors to Healthland, as the exhibit is called, will (if they are children) walk up to the "ticket office" and after registering name, age and weight will get a ticket over the railroad line.

Each stop will illustrate, with scenery, action, life, color and attractive features, one factor in the health of the child, emphasizing it in a manner he never will forget. The Child Health Railroad, "to give free rides to boys and girls knowing their 'number'," is being built by the Child Health Organization of America. Healthland Bank, "a profit-sharing institution which pays big interest," will be constructed by the National Child Labor committee.

At each stop made by the Healthland train the exhibit will be in the form of a house. Ye Healthland Book Shop, "which will beat any million dollar library," will have a separate miniature building of modern architecture to be built by the National Organization of Public Health Nursing.

From the top of Ye Health Crusaders' Castle visitors will get a bird's-eys view of Healthland lying many feet below them. This exhibit will be put up by the National Tuberculosis Association. The University of Minnesota will conduct a Fortune Teller's Headquarters, "where you will learn how much weight you have in this world."

The Milk Bar will be arranged by the Parent Teachers' Associations of St. Paul and Minneapolis. The National Dairy Council will stage the Healthland Zoo. The U. S. Bureau of Education will erect a radio station. Healthland Surprise, "the best place to get the best babies" is being arranged by the U. S. Children's Bureau. Ye Keepwell Tavern will furnish samples of the best foods to keep up proper health. A health movie will be running in Healthland Theatre, prepared by the National Child Health Council.

At the Baby Garage, owned and operated by the American Child Hygiene Association, visitors will see "a service station which demonstrates how to keep a baby in running order." The American Red Cross will arrange the Healthland Art Gallery, "picturing the beauty of service and good health."

"Healthland" will arrive in special cars at St. Paul early in September, and workmen will begin installing it at once.

"Tom," said the boy.
"No, it isn't Tom, it's Thomas."
"And your name?" she asked of the next boy.
"Jackass," said the boy.—Laughing Gas.

Best of All ATLANTIC

—a super-clarified—

GELATINE

"Purest and Best It Stands the Test"

Atlantic costs more to make—the clarifying process takes longer; but it is so pure and so clear that a single glance of Atlantic in the solution will show why it is more economical and actually costs less than corresponding grades of ordinary gelatine. Atlantic passes the pure food requirements of any state in the Union.

Test Atlantic Risk-Free

Send today for a barrel of Atlantic. Use five, ten or even fifteen pounds. If, after a fair test, you decide that Atlantic is not your gelatine, rehead the barrel, return the unused gelatine, and we'll pay the freight both ways. Begin today to place your reliance for uniform quality gelatine on Atlantic. It wins every time.

What Our Good Friends Are Saying About The Ice Cream Review.

It has never been the policy of The Ice Cream Review to use space to blow its horn, and we are often accused by our friends of being too modest—too modest for our good. In order to please these good friends we are going to depart from this policy to let you read four letters which are taken from our files and which represent four different view-points of the service rendered our patrons. Here they are:

From a Subscriber.

St. Joseph, Mo., July 13, 1922.

Editor The Ice Cream Review:

The last several issues of The Ice Cream Review have certainly been fine, and very helpful in solving some of the problems confronting the ice cream manufacturer. We firmly believe that under the new policy of real articles, rather than personals, you have the best trade paper published in the country.

Yours very truly,
THOMSEN ICE CREAM CO.
By F. L. Thomsen.

* * *

From An Advertiser.

Chicago, Ill., Aug. 7, 1922.

Editor The Ice Cream Review:

The July issue of The Ice Cream Review is a dandy. Here of late, we noticed particularly that you are running items that, in many cases, are worth the price of an annual subscription to any ice cream manufacturer.

The ice cream manufacturer who carefully goes through his Ice Cream Review will undoubtedly be benefited considerable, regardless of whether he has a milliom gallon plant or a twenty-five thousand gallon plant.

A publication like The Ice Cream Review might be favorably compared with a National Association, only that it is more national in scope than an Association can be, by reason of the fact that they have not had an opportunity of carefully going into the matter of just what benefits are gotten through your publication.

If an ice cream manufacturer would take the trouble of looking over the July issue of the Review, he would find several articles that warrant re-reading several times, and then apply them to his own method of doing business.

If there is any way that we could help to increase the subscription list of the Review we would certainly like to do so, because we honestly feel that we would be doing the ice cream industry a favor. The Review hits the mark on a number of items, particularly that which applies to broadening the ice cream manufacturers who would have the view of cutting prices, with considerable pleasure (not knowing the bad effects), it straightens out the fellow who is inclined to be slip-shod in his method of sanitation, and it certainly does give technical facts in a clear manner.

You have made such strides in handling your publication in a businesslike manner, it is only a question of time when all of the associations will recognize your magazine as being legitimately entitled to their recognition as the official organ.

Judging from the results that we get from our advertising in The Review, we would say that a great many of your subscribers read the publication carefully.

The kind of service that you are rendering should be appreciated most by the ice cream manufacturers and the supplymen as a whole, and we are going to do our little bit to help the good cause along.

With kindest personal regards from the writer, we are,
Very cordially yours,
THE DAIGGER CORPORATION.
Henry W., Manager.

From the Counsel for Several Advertisers.

Milwaukee, Wis., July 18, 1921.

Editor The Ice Cream Review:

The only regret I have concerning your excellent publication is, I never have time enough to read each issue as thoroughly as I would like and, ought to.

Before me now, are your last four issues—each one full of practical, useful information; specific, general and covering every conceivable angle of the ice cream industry. Aside from the pertinent subjects, there is present in each issue, a breezy, cheerful, good-fellowship atmosphere relating to the 'boys" which keeps one in touch with them. Acquaintances made at conventions are thus further continued and enlivened thru the columns of your paper. I feel that The Ice Cream Review has been a decided factor in establishing that fraternity of good-fellowship so characteristic of the ice cream industry.

In each succeeding issue I have noted a conscientious, sincere effort to disseminate worth while knowledge. I can apreciate how you must spare neither time, money nor personal effort to secure this information. Certainly, you are deserving of the highest regard from your subscribers, your advertisers and their representatives.

I should dislike to see you lessen your efforts or lose enthusiasm. On the other hand, I can readily understand that unless the industry gives you both moral and financial support, such endeavor will, of necessity, grow weary and weaken for lack of encouragement.

The industry needs so "national a publication" as The Ice Cream Review. And I hope you will never lose sight of the fact, that in a measure it falls upon you to do two things, (1) continue to maintain your high publication standard; (2) thoroughly impress the industry with the fact that you are doing so.

In my estimation, you have been too modest in this regard. I am sure equipment and supply house executives will welcome a presentation of the merits of The Ice Cream Review. It is decidedly to their interest that such a publication exists, affording them an advertising medium unsurpassed in its particular field.

Very truly yours,
FRED E. ERIKSEN.

From a Patron of Our Job Department.

Milwaukee, Wis., July 18, 1922.

The Olsen Publishing Company.

Gentlemen:—The following letter, which I received this morning, will undoubtedly prove of interest to you:

558 4th Ave., Milwaukee, Wis., July 16, 1922.

Milwaukee Typographical Union, No. 23,
68 Wisconsin St., Milwaukee, Wis.

Gentlemen:—In compiling a Review of the Pythian Order of Milwaukee County, my biggest worry was to get same placed in the hands of reliable printers.

The Olsen Publishing Co. has set my troubles at rest by printing same to my entire satisfaction, and I therefore wish to thank your members who worked on this book, and also those members who helped boost this project when it was on the verge of collapse.

Wishing you all success, I am,
Yours very truly,
(Signed) C. H. WENZEL.

This office is indeed pleased to see that the harmony and co-operation which exists in your mechanical department fosters working conditions which guarantee the ultimate goal of every printing establishment—satisfied customers.

Respectfully yours,
RAYMOND T. MOORE,
President Milwaukee Typographical Union, No. 23.

We get many such expressions of approval and good will from all parts of the country, and we want our friends to know that they are appreciated. Even though our policy forbids filling up several pages of each issue with these letters we like to get them just the same.

WHOOPEE!! AND AWAY YOU GO

to new and larger profits on a selling campaign that's a "peach". The large and small Ice Cream men are lining up in the ranks. The very simple "GOODY-GOOD PLAN" is yours for the asking

Is your package easy to remember?

"Putting the name across" is never an easy job. People do not make it a point to remember your name when they see it. But if the package is so designed that it will arrest their attention, if it is striking—"different"—they will begin to remember it after seeing it the second or third time. And they will associate your name with your product.

Then, too, your package must deliver its contents in good condition. And only a house that has learned, through long experience how to build the best boxes can do both jobs well.

We have designed and made boxes for exacting organizations in every branch of business. For more than 20 years we have been improving the packing methods of business houses thruout the country.

Our service department will be glad to send samples and quote prices.

How Does Aging Increase the Viscosity of the Mix

Opinions of Cause of Thickening of the Ice Cream Mix During The Aging Process

THERE is no doubt that ageing of the ice cream mix increases its viscosity, thereby producing a smoother product and greater overrun, but nobody seams to know just why, how, or what is the scientific reason for the increased viscosity.

A very prominent man in the ice cream industry recently asked The Ice Cream Review to settle the question by putting it to the trade. It is indeed surprising to note how few of even the largest ice cream manufacturers in the country have any opinion at all on this subject, and that, of those who have opinions, a fine percentage of such opinions are just cracking good guesses. But the fact that should interest everybody connected with the ice cream industry is that many manufacturers and state experiment stations are right now trying to determine the scientific reason, and some of them have already obtained results that are beyond the theory stage.

The information available on this subject at present follows:

The question, which you bring up regarding the viscosity of the ice cream mix is one this institution has been working upon for the last year and a half and expects to continue working upon throughout this next year. We have secured a great amount of data which we feel at this time is not sufficient for publication. I might state that there are a great many factors which seem to increase viscosity after pasteurizing and homogenizing. Close study of the viscosity will show you that there is a very slight decrease in viscosity immediately after pasteurizing and a material increase immediately after homogenizing and after forty-eight hours, cream that has been homogenized is possibly eight times more viscous than cream which has not been homogenized.

We attribute the increased viscosity to the fact that the ice cream mix is of a collodial nature, and it possibly contains gelatine or some gum and considerable casein. The casein is of the same quality as gelatine, and will absorb a great quantity of water in proportion to its weight. Upon absorbing moisture our mix begins to thicken, strange to say however, this viscosity which seems to be due to the collodial nature of casein can almost be completely destroyed by extreme agitation, yet it is practically necessary in the manufacture of a smooth, velvety ice cream.

* * *

We have investigated this phenomenon at this station and have come to the conclusion that it is due entirely to the effect of the low temperature on increasing the hydration of the protein material in the ice cream mix. An increase in the viscosity or relative solidity of the fat with the low temperature, also plays some part in giving the additional thickness. The phenomenon of hydration with increased thickness and viscosity is common to practically all proteins. One sees a similar change occurring when gelatine solutions are cooled to a low temperature; as you know, the lower the temperature at which a gelatine solution is allowed to jell the stiffer will be the resulting jelly. It is something of this character that occurs at low temperature in the ice cream mix only in this case it is the protein materials in the cream and condensed milk which undergo the change. Pasteurization causes the opposite effect and thus makes the mix appear very fluid, or, as we say, very thin. Homogenization restores the original viscosity somewhat, but this is not a protein change but is caused by the breaking up of the fat globules in the cream.

* * *

We believe this change to be due to two separate and distinct agents working at different times, by this we mean 1st. The mechanical change due to homogenization of the mix; and 2nd, The chemical change or development of acidity in the mix after being held twelve to twenty-four hours.

The efficiency of the mechanical action is due directly to the pressure and temperature. As every one knows the fat is found in milk products as minute globules or balls, suspended in the milk serum. Upon being homogenized these globules are broken and smoothed out to form a perfect emulsion with the serum in which they were suspended. The content of these globules is very viscous and when released has a tendency to unite the entire mass and form a more viscous body.

The second agent might be termed the chemical factor and its action takes place after the mix is in the storage vat. Even though the mix is held at a safe storage temperature there will be a slow and persistent development of bacteria, the one with which we are chiefly concerned in this connection is the one which produces lactic acid; this form of acidity up to a certain point is highly desirable. This period is known as ripening. The chief action of the acidity seems to be a partial coagulation of the albumen. Certain agents may be put into the mix, which will materially aid or hasten natures' method of ripening, and under some conditions some claim these may be used to good advantage.

We may have the wrong idea on this matter but practical experience seems to bear us out, however we shall wait with a good deal of interest the ideas and discussions which will no doubt appear in your magazine.

* * *

I feel satisfied that this thickening is caused by a change of the mon-casein lactate to the di-casein lactate. The di-casein lactate being less soluble than the mon-casein lactate results in larger collodial particles with a consequent thickening of the mix. The increase in the acidity which brings about this change is very slight and cannot be tested by the ordinary Mann's acid test. The truth of this theory is partially proven by the fact that the addition of a small amount of hydrochloride acid to a finished mix materially increases its viscosity.

* * *

The thickening of ice cream mix after being held for a period of twenty-four to forty eight hours following pasteurization and homogenization may be due to either one or both of the following reasons:

First, the process of homogenization does thicken the ice cream mix and this is more apparent after the mix has been cooled for some time. In other words, a difference in temperature will have an effect upon the apparent viscosity. As the mix becomes cooler, the viscosity becomes greater.

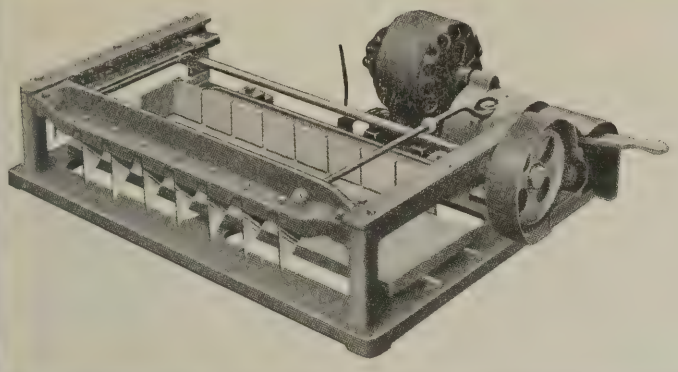
Secondly, if gelatine has been added previous to pasteurization and homogenization, after standing for some time the gelatine tends to jell, and for that reason may cause this thickening of the ice cream mix.

* * *

It is our belief that the increase in viscosity is due primarily to two things. In the first place, there are five known enzymes present in milk. Four of these act upon the milk solids, not fat, and the one remaining acts on the butter fat alone. The lactic acid present, of course, acts upon the milk solids but will not account to a marked degree unless the enzimes are present. Pasteurization to too high a degree or too prolonged will have a tendency to kill these enzymes. Homogenization has a tendency to increase the action of these enzymes by tearing apart the structural elements of the mix, i. e. a pound of dried apples thrown into water to soak and a pound of dried applies which have been chopped very fine, thrown into the same quantity of water—the chopped apples will absorb the water more readily. This is a simile of homogenization.

* * *

I suppose you know that one way in which molasses candy is made to change in its consistency is to expose it to the air, and by pulling the candy the texture of it gradually changes until it becomes thicker and thicker. Whether or not the same theoretical change takes place in molasses candy and ice cream I think no one knows, but it has been demonstrated over and over again that by aging cream of any kind, the texture and consistency changes and becomes thicker, provided the cream is held at such a temperature or under such conditions, that bacterial will not grow in it and the souring process gets started.



Possibly you know that parties who have been in the ice cream business for many years prefer aged, sweet cream to

John Barleycorn and His Grand-daughter

in cold storage during the summer months and using this cream in the winter. Such cream always has a much better body than fresh cream, but the theoretical explanation for the physical change which takes place in the casein by this process of ageing, I think, has never yet been satisfactorily given.

* * *

The main reasons for an ice cream mix becoming thicker after being held for a period of 24 to 48 hours, following pasteurization and homogenization are: 1. The action of bacterial flora as indicated by the rise in acidity during aging. For instance 10 gms. of ice cream mix when tested for acidity before aging required 1.7cc of N-10 NaOH while the same amount of ice cream mix after 48 hours of aging required 3.6 cc of N-10 NaOH. In other words, aging is ripening and hence thickens the ice cream mix or makes it more viscous.

2. Homogenization thickens the mix because it breaks up the particles very fine thus giving rise to more surface within the ice cream mix. In comparing the effects of homogenization and emulsification we find that homogenization increases the viscosity before and after aging more rapidly than emulsification or when the mix is neither homogenized or emulsified.

* * *

We homogenize our whole mix wherein we pasteurize up to a temperature ranging from 160 to 180 degrees. This naturally destroys the viscosity of the dairy products in the mix, which in simple words, brings them back to youth and it requires three or four days aging for the mix to recover from this pasteurizing process, and to undertake to freeze out this mix would result in the operator being unable to get the overrun. This mixture must be held to a temperature of 40 degrees during the aging process, during which time, it regains its viscosity, ages and thickens because it is a difficult matter to get the proper overrun unless the mixture is properly aged and viscolized.

Now, a great many ice cream makers pasteurize the mix up to 160 degrees but before homogenizing it, cool it back to 110 degrees; in that event, the mixture can be frozen with a very satisfactory overrun within 24 or 48 hours and manufacturers who are not thoroughly equipped with holding tanks for aging, usually follow the latter process. Homogenized cream is thicker than the separator cream for the reason that the machine breaks up the fat globules and liberates the oil which gives it a heavier consistency which sometimes deceives the unexperienced because a 30 per cent homogenized product has the appearance to the naked eye as being a fat content as heavy in appearance as 40 or 50 per cent separator product.

* * *

Pasteurization and subsequent homogenization causes the ice cream mix including ingredients to become thin in appearance. This is due to the heat applied in these processes and gives a disarrangement of the butterfat globules in the milk and cream thus causing it to become thin. After the mix is again cooled down it immediately becomes thicker regaining it's viscosity. Within certain limits the longer mix is held out and the lower the temperature the more viscous it becomes. This is merely a physical change not a chemical change. Both the overrun obtained by the ice cream maker and the smoothness of his product is largely dependent on the viscosity of the mix.

* * *

Pasteurizing and heating the mix before homogenization knocks down the viscosity of the mix and it takes from 24

Steel Tanks Not Easily Broken

Some folks entertain the notion that glass enameled tanks are not sturdy. They take the word "glass" to mean easily broken. The accompanying cut proves the contrary to be the case.

eter was broken; otherwise the fire and fall did no damage to the tank.

A few days ago an Elyria truck tank fell over on its side. The truck was finally righted, and continued on its way without damage, and no loss of milk.

This picture shows the fire in which an Elyria glass enameled tank fell four stories and was in the worst of the fire. The gasket was burned off and the thermom-

(Concluded from page 141)

any other. In fact I know of one large ice cream company which has practiced placing sweet cream in ten gallon cans to 48 hours to get the viscosity back, unless a ripener of some kind is used. When it is necessary to use the mix before the 24 hours age is up some manufacturers use double the amount of ripeners. Making ice cream without having some viscosity is very unprofitable for the ice cream manufacturers.

* * *

We are at a loss to know just why this happens. We have tried to study this out, but do not seem to fall upon any theory. We have at times found that in using condensed skimmed milk, and then changing over and using dry skimmed milk powder that the mix will thicken up when we use the skimmed milk powder.

I do not know whether this has any particular bearing on what information you are after or not, but this has happened repeatedly in our factory. The skimmed milk powder has made the mix so heavy that it will not run out the vats in two inch sanitary pipes.

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Jonesboro, Ark.—The Jonesboro Ice Cream Company are going to overhaul their entire plant and put in new machinery during the winter season.

Little Rock, Ark.—The Package Ice Cream Company is now opened under new management.

Porterville, Cal.—Porterville's old creamery has been purchased by the Acme Ice Cream company. The company will use the place for a local ice cream factory and will make extensive improvements here, the total of the investment to be according to the amount of support received from the district—one estimate made being $30,000.

The deal is the result of a personal investigation of this district made by C. O. Swanberg of San Francisco, president of the Acme company and interested in numerous other large business organizations of the coast

William Dreyer of Visalia, will have the local plant under his supervision, and W. I. Ridgway will be local manager.

Trucks for the Porterville plant, have been purchased and the creamery will be ready for use as a distributing point soon.

Galesburg, Ill.—I. V. and J. W. Highlander have opened a new ice cream plant here.

Mascoutah, Ill.—The Eureka Beverage and Ice Cream Corporation has been organized here recently, with capital stock of $25,000. They will manufacture ice cream, cereal foods and beverages.

Rensselaer, Ind.—Emmet Pullin has purchased a building here which will be occupied in the near future, it is understood. This will afford H. E. Randle, the proprietor, much more commodious quarters than he has at his present location.

The building will be equipped practically throughout with new machinery, which will increase the present output to a much greater extent. A new ice making system will also be installed in connection with the other equipment, which will manufacture ice for ice cream making purposes.

Seymour, Ind.—W. B. Gallemore, owner of the Seymour Ice Cream Company; Ernest Denk, superintendent, and A. R. Nielsen, of Palm Beach, Fla., have organized a company which will operate an ice cream plant at Palm Beach. The factory will be opened this fall.

Edgewood, Ia.—C. B. Madison, proprietor of the local ice cream factory, has been making extensive improvements in his plant and the work is now completed. The new addition is a freezing plant with a capacity of five tons of ice a day. The plant is in successful operation.

The plant is not making ice in cakes, but is freezing cream in a room where the temperature is kept at zero or below. There are two rooms, in the first the temperature is at freezing and in the other at zero. The plant has a capacity of twelve hundred gallons of ice cream a day if run full time.

Estherville, Iowa.—The Hutchinson Ice Cream company has purchased the branch factory of the Northwest Ice Cream company which was recently started on south Sixth street. This gives the Hutchinson people a clearer field in this part of the state.

Spencer, Iowa.—The Spencer Dairy Produce Company, formerly owned by Jensen and Christensen, has been purchased by M. W. Hensley of Lake Park. Mr. Hensley is an experienced creamery man and expects to run a strictly up-to-date ice cream and butter plant. He will also continue the distribution of market milk and cream in the city. Mr. Jensen has been retained by Mr. Hensley to assist him in remodeling the plant.

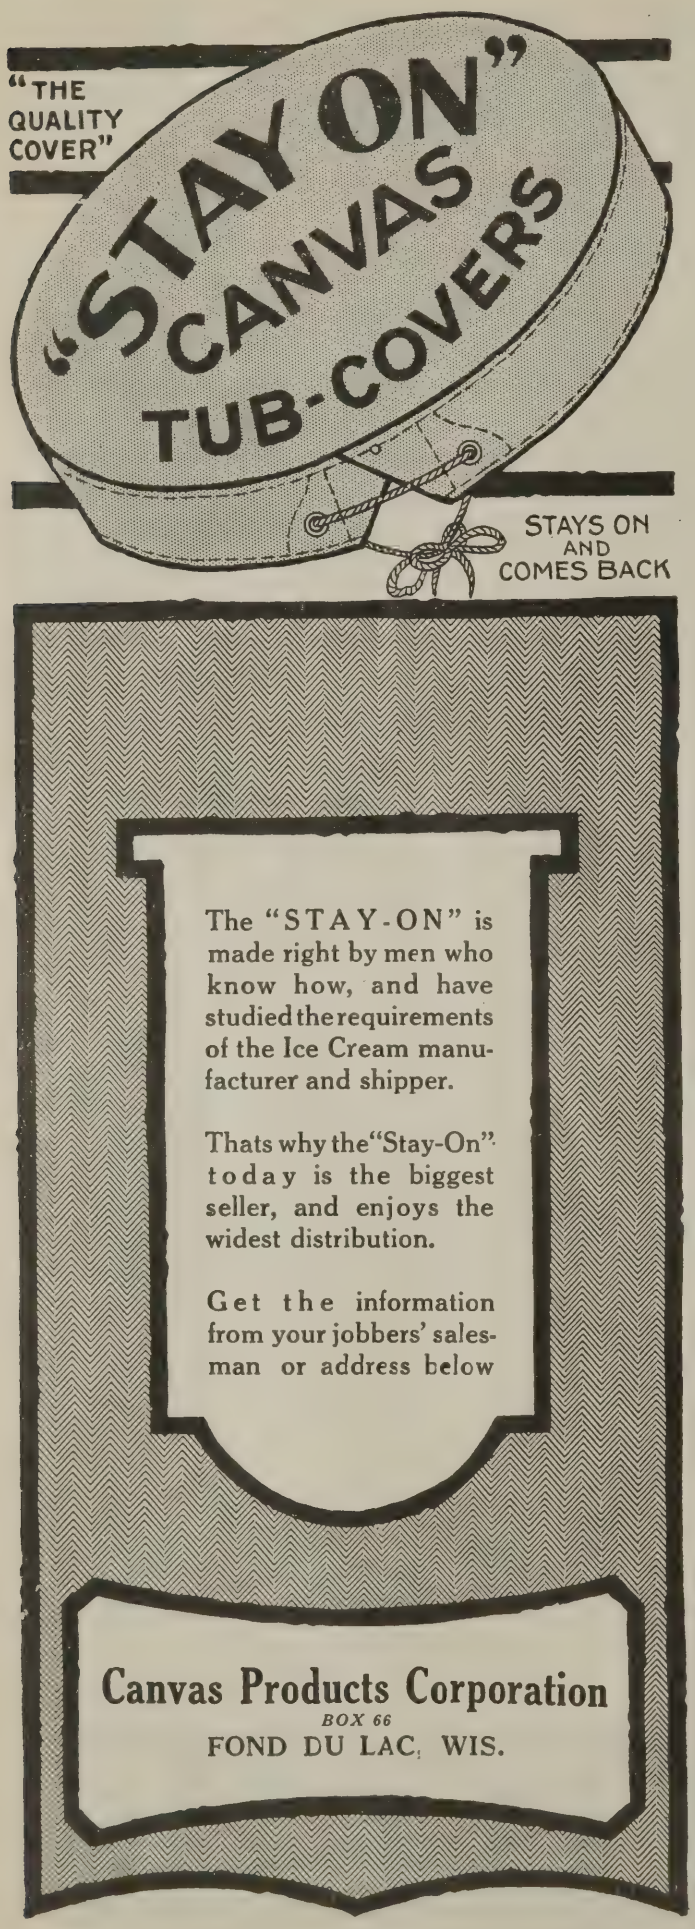
Colby, Kans.—The Golden Belt Creamery Company of Hays is planning a creamery here and has already secured a site for the plant. The company will handle all kinds of dairy products, and will manufacture ice cream.

Pikeville, Ky.—The Pikeville Ice Company have just completed an addition to their plant here and will engage in the manufacture of ice cream.

Scottsville, Ky.—The Sure Pure Ice Cream Co. have opened for business in the old Scottsville Bottling Works building.

Good Light Is an Indication of Cleanliness and Pure Products

Good lighting plays an important part in the appearance of any ice cream plant and office. Customers and the public in general instinctively avoid dark and gloomy interiors and prefer only those food products made in clean, well-lighted plants.



Denzar is the ideal light for the office and various work rooms of the ice cream plant. Smooth as a china dish, and requiring cleaning only at long intervals because of its dust-proof construction, it radiates light that is bright without being dazzling, and that is so uniformly distributed that desks, shelving, racks and work tables are profusely illuminated.

No doubt you realize the value of good lighting, but until you are familiar with the distinctive features of Denzar you will not know how little good lighting really costs.

Send us the ceiling height, dimensions, and color of walls of space to be lighted and we will suggest without obligation an economical but efficient installation that will give it added attractiveness.

BEARDSLEE CHANDELIER MFG. CO.
228 South Jefferson Street
CHICAGO

DENZAR

Baltimore, Md.—The Superior Ice Cream Co acquired a building which will be remodeled and equipped for ice cream manufacturing.

Ann Arbor, Mich.—The Wurster Electro Pure Company, owned by Fred Wurster, is constructing a dairy products plant here which will handle all kinds of dairy products, including the manufacture of ice cream. The plant is already nearing completion and it is hoped that it will be equipped ready to run by the last part of September, in order to accommodate the extra trade occasioned by the opening of the University of Michigan.

Leroy, Minn.—Chris. Brown will open an ice cream factory here.

Stillwater, Minn.—Starkel's Inc., confectionery, ice cream, etc., has been incorporated here with capital $50,000. The incorporators are: C. E. Sutton, John A. Sutton and Anna K. Sutton.

McCook, Neb.—The McCook Ice Cream Company was recently incorporated with capital stock of $25,000. C. B. Miller, A. H. Halbert and M. M. Halbert are the incorporators.

Syracuse, N. Y.—The new plant of the Cloverland Ice Cream Company was formally opened recently.

South Dayton, N. Y.—The Pure Gold Ice Cream Company has taken over the F. T. Bush ice cream and creamery plant at South Dayton as a branch factory.

Barberton, Ohio.—The Tawney Ice Cream Co. will put up several buildings, including a modern ice cream factory and dairy and an up-to-date garage.

The main building will cost approximately $12,000.

Machinery for the structure is already being received. The garage will cost $5000 and will be built on property adjoining the factory.

East Stroudsberg, Pa.—The Weeds Ice Cream Company, Allentown, will erect a branch plant here.

Erie, Pa.—The Lake Shore Ice Cream Company will undertake the construction of a $20,000 addition to its present plant at once. W. A. Dart is manager.

Charleroi, Pa.—One of the most enterprising business firms in Charleroi is that of P. Galistri & Sons, who conduct a wholesale ice cream business here. This firm is comprised of Peter Calistri, Jermia Calistri and Leo Celistri.

Williamsport, Pa.—John F. and Charles P. Morrison expect to make their future home here having purchased an ice cream, confectionery and bakery business establishment in this place.

Woonsocket, R. I.—The Oak Knoll Farm have added another Grothe refrigerator body to their delivery equipment.

Pawtucket, R. I.—What Cheer Ice Cream Co. have added another Grothe refrigerator body. This makes a fleet of eight bodies.

Woonsocket, R. I.—The Cronan Ice Cream Co., have added another Grothe refrigerator body to their delivery equipment.

Dublin, Tex.—A new ice cream plant has been opened for business here, and is located two doors south of the D. N. Bank. It is under the ownership of Cormany and Long.

Berlin, Wis.—Recent improvements made on the building of the Berlin Ice Cream and Dairy Products company, make it an outstanding structure in the town.

The entire building has been painted in white with a narrow strip of green around the lower part. Two concrete landings have been placed in front, flanked at either end by a concrete bed and small flower plots. Cement which slopes from the sidewalk to the pavement obviates the usual curbing.

Approximately 200 gallons of ice cream are made daily at the plant. Butter is also made, and sweet cream and skimmed milk are shipped out.

Racine, Wis.—The Fox Ice Cream Company have increased their capital stock to $100,000.

Ridgewood, Wis.—The Ridgeland Co-operative Creamery Co. has been incorporated with capital stock of $10,000. The incorporators are L. Handorf, E. Kahl and W. L. Knopton.

The Customer: Fifty-five cents for a haircut! How's that?

The Barber: The haircut was merely to illustrate my scientific lecture on the care and treatment of the scalp, for which I charge four bits. The nickel's for war tax.—Columbia State.

The Message Headed by 2000 Persons

That number have already made their plans to attend the National Exposition. Hotel reservations and reports from every section show this.

It is only the unprogressive manufacturer who is not making preparations to be there.

Ice Cream Manufacturers May Reserve Rooms Now At The Hollenden Hotel

THE National Exposition will be held in conjunction with the 22nd annual convention of the National Association of Ice Cream Manufacturers.

The convention opens Monday, October 16th. It ends Wednesday, October 18th.

The National Exposition opens Tuesday at noon, October 17th, in the new $6,000,000 Public Hall.

It is 1922's only exposition of ice cream machinery, equipment supplies and services.

It is for ice cream manufacturers exclusively.

It will be almost twice as large as any previous exposition.

It will include every display material, piece of equipment and proven service needed by ice cream men.

It is a market and educational exchange set up for an industry.

1328 BROADWAY **NEW YORK CITY**

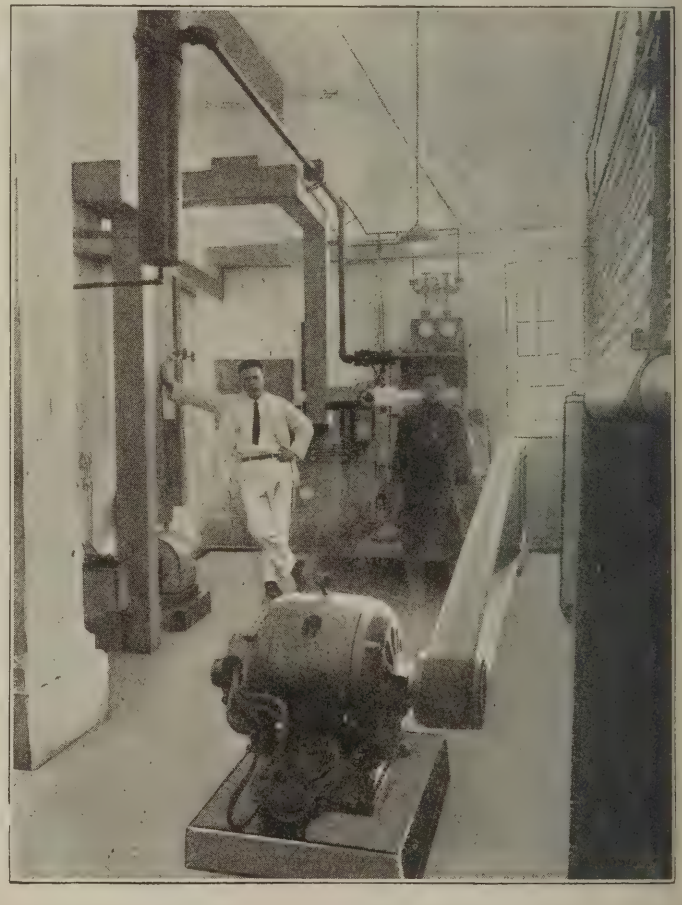
Is China Discovering Its Sweet Tooth?

The First Modern Ice Cream Plant Installed at Hongkong by the On Lok Yuen Co. May Presage Sweetening Up of the Celestial Kingdom

Is John Chinaman beginning to discover that he possesses as sweet a tooth as his white brother of the western Hemisphere? Recent developments by the On Lok Yuen Co., say "Yes." Can it be that John's chop suey, rice and tea diet, stretching back centuries of time, is at last to be varied by an occasional dish of ice cream?

Cheung Kat Shing, Manager of the On Lok Yuen Co., emphatically answers in perfect English, "You bet my countrymen eat ice cream. They take to it like your Broadway flapper takes to bobbed hair. When one of them sticks his sweet tooth through an ice cream cone, he is just as big a booster for ice cream as any boy scout in the States."

That sounds as though John Chinaman would soon be tickling his palate with Eskimo Pies, enjoying seeds and all in Pickanninny Freeze or eating a Babe Ruth baseball. Well, John may be willing, but there are a lot



Cheung Kat Shing, wife, relative and 6 good reasons why China is discovering its sweet tooth.

of unfarvorable conditions to be overcome first, as the experience of the On Lok Yuen Company will bear out.

In the first place, there are no dairy cows in China. No cows, you ask? No. There are perhaps a few imported ones, but they are so scarce, that we might as well forget about them.

How then, can the On Lok Yuen Co. produce ice cream and butter with no cows in China? Answer, they import the raw materials in storage from the dairy herds of distant Australia. The On Lok Yuen Co. import skimmilk powder and canned butter. Powder, plus water, makes skimmilk. Skimmilk is mixed with the canned butter and then run through an American made homogenizer, is then mixed for ice cream in American Vats and finally frozen in American freezers so that John Chinaman and the British seaman in Hongkong may have their ice cream.

The entire equipment used in the On Lok Yuen Company plant is American made throughout. It was selected personally by Manager Cheung Kat Shing on a visit to the United States a year and a half ago and purchased from the Davis-Watkins Dairymen's Mfg. Co. Included in the machinery ordered, were two 200 gallon ice cream mixing and storage vats, a 400 gallon storage vat, two 50 quart brine freezers, a 90 gallon homogenizer a large churn, complete refrigeration system, cooler,

Corner of the On Lok Yuen Co. plant showing cooler and ice-making compressor.

milk pump, and all ice cream cans, tubs and brick cabinets and moulds.

Evidently the name Cheung, which is Kat Shing's family name, stands for "Show Me" for he made a thorough study of American ice cream factories and milk plants in San Francisco, Chicago and New York, during the course of which he became thoroughly familiar with the latest equipment and methods for the manufacture of ice cream.

As can be seen from Mr. Cheung Kat Shing's photograph, shown here with his family, he is a keen, alert Chinaman of the most progressive type. When the machine for a plant of the size ordered above is shipped, usually the manufacturer sends an erector to install the

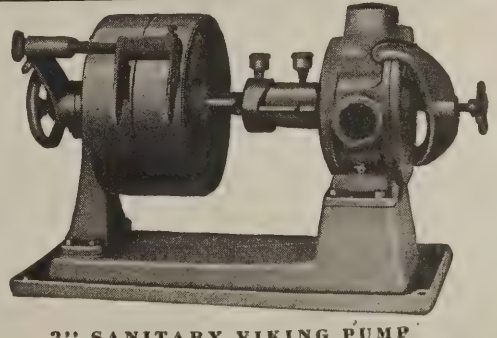
equipment, but Cheung Kat Shing said it would not be necessary to send a man, as he and his men could do the installing themselves.

How well he succeeded and what results they have since achieved in merchandising ice cream and confections, you may judge from the accompanying illustration, and Mr. Cheung Kat Shing's letter to Mr. S. J. Davis, written July 4th, in which he states, "Candy and ice cream store is now doing a cash business of $400.00 a day, though it has only been open for business for a very short time."

If the success of the On Lok Yuen Company's plant can be taken as a criterion, John Chinaman is destined to be a coming world customer for ice cream, and incidentally for considerable ice cream, milk and creamery machinery and equipment.

Of course, Hongkong is a British possession, the population of which is largely British in customs and social life hence the patronage of the On Lok Yuen Company is doubtedlsss largely British, yet a growing share of the business is coming from the Chinese quarter. That share will very likely grow as John Chinaman's sweet tooth is developed.

Who will deny that this first ice cream plant foreshadows the time when the leading cities of the Celestial Kingdom will have ice cream parlors as well as chop suey shops, when Eskimo Pie is not an unknown term in Peking, and when Pickaninny Freeze and Shanghai Sundaes are frequent items on the yellow man's bill of fare.



For cleanliness and completeness of equipment, this ice cream making department of the On Lok Yuen Co. is surpassed by few American plants of equal size.

JOHN J. GROTHE CO., INC. AT CLEVELAND SHOW.

The John J. Grothe Co., Inc., manufacturers of refrigerator bodies, will occupy booths 87, 88, 89 and 90 at the Cleveland show. They expect to have a number of our representatives present namely:

Mr. J. N. Gurdy, president; Mr. A. B. Mackay, vice-president and general manager; Mr. J. E. Burke, Jr., secretary and treasurer. Also Mr. Frank L. Ruzicka, general manager of the St. Louis branch, and Mr. John Mitchell, general manager of the Canadian branch.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

TRADE'S AMPLE SUPPLIES CHECK BUYING MOVEMENT.

Under pressure of a steady and strong demand from consumers throughout the earlier months of the year, combined with difficulties and delays in getting shipment from refiners, the jobbing trade placed orders rather more freely than was actually required to maintain supplies at this season of the year. This, at least, is the interpretation placed by most trade observers on the existing situation. The influence on consumption of the rapid rise in prices, the interruption of fruit shipments by strikes, and the disappearance of export demand have combined with the well-stocked condition of distributors to keep the market dull and quiet, with a further weakening in prices during the week.

Present Requirements Covered.

The amount of sugar that jobbers have coming to them, either on contracts in the hands of refiners or en route to destination, is said to be considerably larger at the present time than was generally supposed a few weeks ago would be the case. With free deliveries on these outstanding contracts, the trade is not in need of making further commitments for some time to come. In some quarters it is estimated that it will be the middle of September before buying will show much activity again.

To add further to the absence of activity, speculative buying of actual sugar by jobbers has altogether ceased. Until recent weeks the sugar market has shown a steadily advancing trend from the beginning of the year, with the result that jobbers have been making very good profits by anticipating their requirements to some extent, which has led as a matter of course to a considerable amount of speculative buying.

Europe Not a Present Buyer.

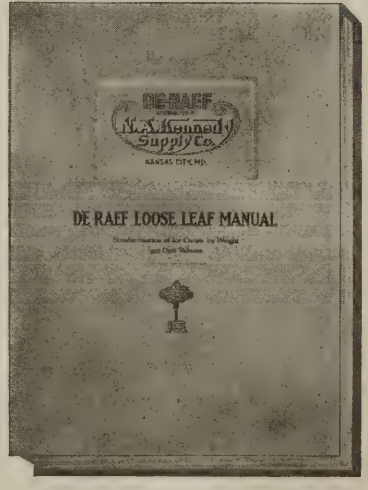
The trade having made its profit, it is pointed out, is not anxious to take on any further obligations in a market which has shown a reaction, and refuses to buy now except what is actually needed for immediate consumption.

This attitude does not appear alone to govern in this country, but New York brokers having foreign connections report that European buyers, particularly those of the United Kingdom, are not anxious to make purchases. Cables from Great Britain are to the effect that speculative buying has ceased there, at least for the time being, which would seem to indicate that not all of Europe's heavy purchases during the early summer were for immediate consumption.

The destruction of confidence in the market's position through the resale of export sugars a couple of weeks ago seems to have caused more damage than could have been anticipated at that time, and some apprehension is being shown as to the ultimate destination of sugars ordered for export during September.

* * *

Supply and Demand in 1922 and the Outlook for 1923.



"The world's available supply of sugar for the year 1922, judging by the results of the campaigns that have been concluded and the present outlook for coming crops, will be about 1,400,000 long tons larger than the total supply for last year," says the editor of Facts About Sugar. "The difference is due almost entirely to the surplus carried over in Cuba from the previous year. Gains in production have been made in certain sections, but these for the most part have been offset by losses in other parts of the world.

"The most noteworthy feature in the movement of sugar during the year has been the distribution of Cuba's record breaking supply. Shipments from Cuba up to August 1 had amounted to nearly 4,250,000 long tons, a greater quantity than ever before was exported from the island in the course of a full year. Of this amount about 60 per cent was taken by the United States and 40 per cent by other parts of the world.

"The relationship between supply and demand during the year presents a striking contrast with the year before. While a considerable surplus remained at the and of 1921 from the smaller available supply, the indications are that the larger stock available this year will practically all be absorbed. This does not mean that the world will be denuded of sugar at the close of 1922 but that supplies will be limited to normal trade stocks and to the customary carry-overs in those countries in which the season of production overlaps the turn of the year or coincides with its final quarter.

"This situation merely illustrates anew the fact that normally the world's output of sugar is consumed in the course of the year and that prices are so adjusted in the world's markets by the interplay of supply and demand as to produce this result. There have been exceptions to this rule, as in 1918, when difficulties in transportation prevented equable distribution, and again in 1921 when the price of Cuban sugar was fixed by an official agency and did not respond directly to the action

of supply and demand. This year the various governmental restrictions that had been continued from the war period were, with few exceptions, removed. Prices have been lower than for several years past and these lower prices have been reflected in an increase in consumption, which has been especially marked in the United States and to a less degree in Europe.

"Another factor that has contributed to a heavier consumption of sugar in 1922 has been the general improvement in industrial conditions. The year has been one of recovery from the depression that marked the latter part of 1920 and practically the whole of 1921. There has been far less unemployment this year than last and conditions among agricultural producers have been much better.

"These two conditions of lowered prices and improved purchasing power will bring the consumption of sugar in 1922 nearly up to the point it had reached before the outbreak of the world war, with a total of nearly 18,000,000 long tons. Production, however, has not kept pace with this increase in consumption, which has been made possibly only by the existence at the commencement of the year of the surplus stocks previously referred to. The outlook for 1923, therefore, if the world receives no industrial set-back such as cannot now be foreseen, is for a smaller total supply than has been available this year. The logical sequence of this condition will be the maintenance of a higher level of prices than prevailed during the first half of the present year as a check to consumption needed in order to prevent demand from outrunning supply."

MORE ABOUT VISCOSITY OF MIX.

There are many things yet to be studied in reference to the viscosity of milk and cream and ice cream mixes. Below are shown micro-protographs which might be of some interest. You will note that No. 3 shows the cream immediately after pasteurization. The fat globules are separate. If this cream is allowed to remain at a low temperature for from 24 to 48 hours you will find that the fat globules are clumped together. There will be several single globules in the field but also many fairly good sized clumps. It is evidently due largely to the fact that the viscosity of the cream is increased by ageing. I also wish to call your attention to No. 2 which shows the cream after homogenization. You will note the large clumps of fat in the field and only comparatively few single fat globules.

Some years ago we had some little trouble with the plain cream which was sold as retail from the college creamery. We made a rule to sell 20 per cent cream at all times. During the spring of the year that cream would appear quite thin. There would be a thick layer of cream at the top of the bottle and milk at the bottom and the consumers would make complaints stating that there was milk in the cream. During the fall and winter months the cream was very satisfactory. The reason for this difficulty was mainly due to the character of milk produced during the spring of the year. Most of the cows came in fresh at that time and the fat globules produced in that milk were larger than the fat globules in the milk produced during the fall and winter months when the cows were further advanced in the period of lactation. We started our instructor in charge of the market milk department at that time to carry on experimental work on preparation of the cream that was sold at retail. We left it to him to determine to what pressure the cream might be exposed without giving the cream the feathery appearance when added to hot coffee. We worked on the theory that the large fat clumps as you note on the micro-photograph would rise to the surface after they reached a certain size and that they were responsible for that feathery appearing substance. We had already found that the fat clumps increased in size almost in direct proportion with the increase in homogenizing pressure. The work carried on along that line here for several months resulted in that we started to homogenize all of the cream used for retail at a pressure of fifty kilograms per square centimeter with a Gaulin Homogenizer. At that pressure a satisfactory result was obtained. The cream treated in that way was plainly labeled and a special letter was sent to all consumers informing them how it was treated and that even though the cream might appear to be a trifle richer than it used to be it only contained 20 per cent fat and that our object in homogenization was merely that of giving such a consistency to the cream so the last drop in the bottle would be exactly the same as the first.

Pasteurized 18% Cream.

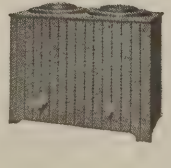
18% Cream Homogenized at 300 Kilograms (661 lbs.) and 180° F. and Slowly Cooled.

It is true that the casein is possibly to some extent responsible for the increase in viscosity but the writer feels that the big factor responsible for the increase in viscosity is the breaking up and clumping together of the fat globules. By breaking up of the fat globules a greater amount of the milk serum will be fixed or held around the fat globules due to the surface tension. By the fat globules being clumped together an additional amount of serum will be fixed or held by the fat globules.

If the cream after homogenization stands, this clumping together of the fat globules becomes more pronounced and gradually the viscosity is increased. It is true that after the filler has also been added that the filler will naturally also play a big part in causing an increase in viscosity.

We have carried on considerable work during the past year on this subject and we find that as freezing of the mix progresses the fat clumps are again broken up and the viscosity of the mix reduces accordingly. It has been our experience that if the mix is aged for 24 hours we will obtain as good results in the final product as is obtained by ageing for a longer period. M. M.

"Don't knock the man above you. Don't try to pull him down. If you want his job, boost him into the next higher job and the chances are he will take you with him. If you try to knock him down he will know it and knock you down first. He has the advantage." This is good sense as well as good gospel.



If you are tired of your business, don't worry over it. Advertise it for sale in The Ice Cream Review Want Department.

"PICANINNY FREEZE—EAT SEEDS 'N ALL."

(Concluded from Page 18)

very attractive store cards. These are prepared by the Picaninny Freeze Company of America and distributed through the manufacturer. A series of dealer folders, also prepared by the parent company, and sent out by the manufacturer, have secured new retail outlets for the new frozen dainty.

In some instances, consumer folders have been distributed in various ways, for instance, such as by dairies with their milk deliveries.

In practically every town where Picaninny Freeze has been introduced, the results from the first day of the sale have been even more gratifying than most optimistically expected. In Baltimore, Md., for instance, on the first day of the sales campaign, more than 3,000 dozen were sold by one licensed company. Results in other towns have been equally gratifying.

The Picaninny Freeze Company is a firm believer that it takes new ideas to sell a new product. In addition to the newspaper, poster, store and window advertising developed in this campaign, they have originated a clever patented carrier for the sale of Picaninny Freeze at resorts, ball parks, theaters and other places of public gathering. These carriers are shaped and painted to look like real watermelon. They are lined with cork insulation and have a tiny ice tray to keep the Picaninny Freeze hard.

Another novel selling aid developed by the parent company for the licensed manufacturers is a huge watermelon shaped patented push cart, attractively painted in the natural watermelon colors. In cities where these have been tried out, results have been surprisingly large and consistent.

A NEW MINNEAPOLIS ICE CREAM PLANT.

The Northwestern Ice Cream Company of Minneapolis, Minnesota, began operations the latter part of August with a daily capacity of 1500 to 2000 gallons of ice cream per day. The new plant is operated co-operatively under a plan directed by Mr. George A. Ball.

The new company is incorporated for $200,000, and $50,000 of this stock has already been paid in.

The company is operating in a building, part of which is being used by the Hygienic Ice Company, the close co-operation of which concern will be a big factor in the economical production of ice cream by the Northwestern Ice Cream Company. All damaged cakes of ice from the ice company will be used by the ice cream plant at the low rate of $3.50 per ton. Cheap power, at 2½c per kilowatt, now enjoyed by the ice company will also keep production cost down to the minimum for the ice cream company.

The equipment and layout of the plant is designed to manufacture only the very highest grade of ice cream for distribution to retail stores operated by the members in St. Paul and Minneapolis. A strong advertising campaign will be instituted to push the sale of ice cream in the Twin City territory. The freezers will be operated in connection with the 200-ton compressor owned by the Hygienic Ice Company. This will enable the Northwestern Ice Cream company to keep the manufacturing cost per gallon down to a very low figure, enabling the retail members of the combination to sell ice cream to the public at a very reasonable rate. The plant is equipped with ice cream machinery made by the Davis-Watkins Dairymen's Manufacturing Company.

KEEP AN EQUIPMENT CATALOGUE HANDY.

Ice Cream Men Stage Wonderful Exhibit

Interesting and Educational Methods Adopted to Advertise Ice Cream at Pageant of Progress Exhibition.

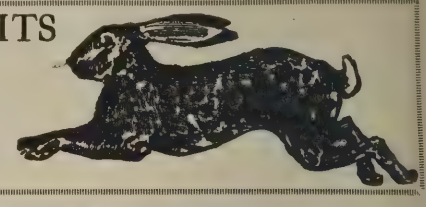
VISITORS to the Municipal Pier, where the Chicago Pageant of Progress was staged last month, were treated to a most interesting ice cream advertising display. The exhibit was the result of co-operation by members of the Chicago District Association of Ice Cream Manufacturers. A complete ice cream factory was in operation and each piece of machinery was placed so that everyone could see it function. Over three hundred gallons of ice cream were made daily and sold to visitors. The mix was brought to the pier where it was frozen and packaged for distribution. Each operation was carried on slowly so that the visitor could get the most out of it.

A representative of The Ice Cream Review experienced genuine pleasure, standing near by and listening to the various comments made by visitors. "Why they don't even touch it with their hands," "Everything looks so nice and clean," "That must be good ice cream," "Notice how they handle it," "Gee, that makes me want some right away," "That shows that ice cream nowadays is made good and clean" were some of the comments freely passed around.

Men who have had experience in advertising ice cream are liberal in praising the exhibit. They have marked it down as one of the most interesting and instructive exhibits ever put on to educate people to the fact that "ice cream is a food, not a fad." Each visitor was handed a neat little booklet from which we quote a few paragraphs as follows:

"Just as the people of Chicago have spent over $5,000,000 to make the Municipal Pier the peer of any similar undertaking in the world, so we ice cream manufacturers have used every new and scientific method in producing ice cream unequalled in purity and richness.

Both are products of unceasing thought and labor—and both in their way are bringing joy, happiness and health to millions.



Pure ice cream used to be considered a luxury. Today it is the dessert of the American table—the refreshment of the day. Rich in food value, containing a wealth of vitamines—which are necessary to health and success. The most economical food—the dessert for every one.

We manufacturers are pledged to keep our ice cream pure—as pure as any food set upon your table."

Among the various items of equipment used in making the display were six Continental Freezers, a Mojonnier Overrun Tester, and a Mojonnier Brick Packaging Machine. A Mojonnier Cream Tester was also on exhibition. The United Cork Companies erected a complete refrigerator and insulated it with Cresent cork board. A York Compressor was furnished and installed by the Westerlin-Campbell Company.

Exhibits in connection with operating ice cream factory were made by the following firms—The Elite Chocolate Coated Baseball Company, Miss Alice Middleton substituting for Babe Ruth; Horine & Bowey Company with fruits and flavoring extracts; The United Chemical Company with pure food gelatine; The J. B. Ford Company maintained an attractive booth in charge of the "Big Chief of Wyandotte Fame;" The Morton Salt Company was on hand with its product "It Pours when it Rains;" The Davis-Watkins Dairymen's Manufacturing Company exhibited a line of Progress Ice Cream Freezers and their Ice Cream can washer.

The ice cream manufacturers of Chicago are to be congratulated on their splendid exhibit and their impressive style of advertising. We are told that much of the credit for the success of the undertaking is due Mr. Olin of the Lawrence Ice Cream Company, who was chairman of the Exhibit Committee of the Chicago District Association of Ice Cream Manufacturers.

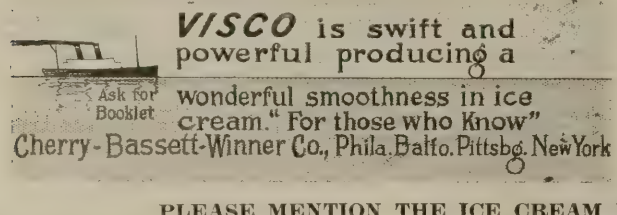
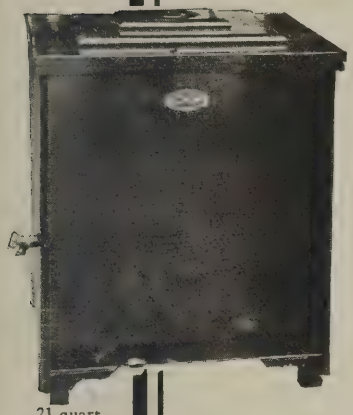
TURNING THE TABLES.



A story comes to us that Mr. F. R. Bennett, proprietor of the Bennett Creamery Company of Wichita Kansas, and known to his host of friends as "Ransom," turned a neat trick recently when a number of his local friends attempted to make life interesting for him. He returned from a honeymon to find a crowd ready to do things to him. He and his good wife disguised themselves and mingled with the multitude for several hours. Everybody wondered where the bride and groom had disappeared to. When the true situation was revealed everybody agreed that the joke was on the other fellows. It was a neat trick. Congratulations, "Ransom."

* * *

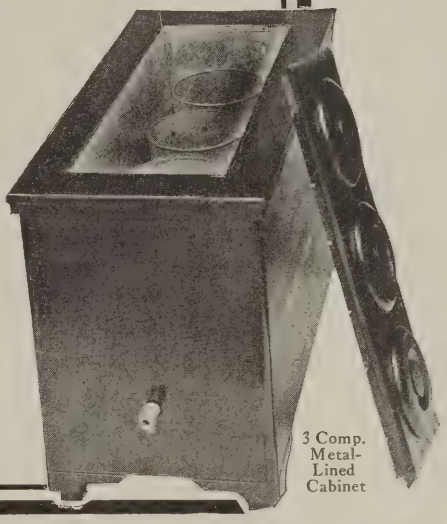


Weight of Ice Cream.

The greatest problem confronting the Ice Cream Manufacturers of today is a uniform weight per gallon on all ice cream, regardless of flavors. Having visited plants in Kansas, Oklahoma, Nebraska, North Dakota, Minnesota, Iowa, Missouri, Pennslyvania, New England, New Brunswick in 1922, I find conditions pretty much the same in all plants visited in these States, a variation of from one-half to 2 pounds per gallon; in fact I have seen 4.0 pounds per gallon ice cream and 6.0 pounds per gallon ice cream in plants located in the same city and selling for the same price per gallon; here we have an ice cream that varies in quality and food value, and yet the butter fat, milk solids, sugar contents would be standardized from day to day in the mix. Ninety per cent of all plants visited shows a greater variation on their specials, such as chocolate, fruits, nuts. When the Ice Cream Manufacturer realizes what an extra one-half pound per gallon means on his entire day's run, he will realize where his profits have been going especially in the New England States where ice cream is selling for $1.20 to $1.30 per gallon. Allowing five pounds per gallon, an extra one-fourth pound means a loss of 6 cents per gallon; one-half pound, 12 cents per gallon. Take an average small plant of fifty thousand gallons annual production and a one-fourth pound per gallon at $1.20, means a loss of 6 cents per gallon and a total loss of $3,000 annually.

I visited plants making over a hundred thousand gallons, having a loss of one-half pound per gallon, and

ECONOMY CABINETS



21-quart Brick Cabinet 32 dozen Eskimo Pies

3 Comp. Metal-Lined Cabinet

HOMER MFG. CO.

HOMER CITY, - - PENNA.

several cases have noted a pound loss per gallon, and yet the ice cream manufacturers have never given this a thought. Is it any wonder why some of the Ice Cream Manufacturers are having a hard time, and complaining of the weather, price, poor business, etc. Take the Middle West, where ice cream is selling for $1.00 per gallon, a one-fourth pound on a gallon of ice cream over 4.75 pounds per gallon means a loss of 5 cents per gallon, and yet conditions are very much the same in the Middle West, East and New England States; very few plants can standardize to a uniform weight per gallon in specials, fruits, nuts, chocolate, as with these added ingredients to the freezer after mix has been entered, changes the weight of the mix. Results; an estimated overrun, variation in weight per gallon and quality, as this class of ice cream invariably runs greater weight per gallon than vanilla. Personally, I cannot understand why all ice cream should not be a uniform standard weight per gallon—Ice Cream being the only milk product that has no standard weight per gallon.

If time and space was permissible, no doubt more convincing facts could be given, but no doubt some Brother Ice Cream Manufacturer will follow this up with a more convincing article for your valuable magazine, and either undertake to dispute or agree on the merits of this article.

MANUFACTURERS
Hancock **Michigan**

. . . . . IN THE

SUNNY SOUTH

Notes from Dixie Relative to the Ice Cream Industry by our Special Correspondent . . .

MR. CRADDOCK GOINS 34 Highland View ATLANTA, GA.

There is much to be said for the 1922 ice cream season in the South. While the summer months were marked by a falling off of about 10 per cent under the normal output for this period, results have been very satisfying in more than one way.

The fleeting summer, although leaving much disappointment for many whose optimism was based upon early favorable indications, can hardly be recorded as a period of pronounced trade weakness insofar as the ice cream industry is concerned; for a dispassionate review of the past few months impresses facts that leads close observers to take a most sanguine outlook for the future of the wholesale ice cream industry in Dixie.

Hampered by economic developments of a nature very obstructive to the trade, especially in what are generally regarded as the luxury line, the Southern industry has reflected a basic strength that leads many to see a much stronger ice cream market for the approaching fall and winter months than usually prevails below the Ohio River.

There no longer is any doubt that the ice cream situation in the South has resolved itself into a condition largely controlled by the general economic situation. This fact, more than anything else, denotes progress of a very pleasing nature.

In times past ice cream has been sold in the South in accordance with public demand, but some time after the bells startled the inhabitants of quiet retreats very early one morning last January, it was evident to lookers-on that ice cream manufacturers were beginning the year 1922 in the South with one of the most extensive programs for developing ice cream consumption than this section has ever witnessed.

The Southern ice cream industry has awaked to its possibilities. There was no room for doubting this after early preparation took shape in the spring.

Supported by more newspaper and bill board advertising than the Southern public has ever before seen, the season "got away" to a flying start, as the gentlemen around the race-tracks are wont to observe.

It was this momentum and the application upon the parts of the manufacturers of the most intelligent order of business methods that kept the sales of July and August up to the level maintained.

It is not to be understood that the falling off of ice cream sales in the summer necessarily means that 1922 will go down as a bad ice cream year in the South.

When it is reflected that the industry took every advantage of early favorable conditions and strongly held up in the face of a later agricultural depression that sharply restricted buying-power in this section, it can be understood that the efforts of the Dixie manufacturers are approaching more sound and constructive lines.

Agricultural depression in the South means industrial depression, for the business of these states revolves very largely around the farm pursuits.

A condition such as that prevailing in the past few months, with farmers struggling against fertilizer bills two years unpaid, added to the railroad strikes, a few years would have operated as a much more serious check to ice cream sales.

The happy outlook now is based not solely upon improvement in general conditions, but also upon the secure position of the ice cream industry itself. That is, the ice cream manufacturers are prepared to make the most of every favorable advantage that may develop.

The ice cream business is being taken more seriously in the South, both by the manufacturers and the public-at-large. The manufacturers are beginning to handle their business along the same kind of advanced lines as followed by other business men.

It is at this time that we are strongly reminded of the prediction at the last Southern convention of President W. M. Sidebottom, who upon retiring from office, expressed the opinion that the coming months would show Southern manufacturers "more closely following the approved business practices of the age than ever before has been the case."

Mr. Sidebottom, who is one of the most far-sighted members of the southern industry, may derive much satisfaction from the knowledge that many others of his predictions of constructive advancement have held good.

There has been more newspaper and billboard advertising by Dixie ice cream manufacturers in the past two years than in the previous ten years, the present time especially witnessing a great amount of advertising.

The value of dairy products is being appreciated by the public more than at any other time in history.

Perhaps the most pleasing thing of all in connection with the Southern market is the expansion of the ice cream period. Although the favorable climate makes it possible for ice cream to be refreshing in the winter months in this section, only recently has there been any progress in inducing the public to eat the frozen beverage to any considerable extent out of the summer months.

But with the situation so well in hand as it is now, it will not be at all surprising to many, if ice cream sales in September and October do not surpass the sales of July and August in the Southern states.

Steadily improving business conditions support this belief. In the last few months Southern farmers have disposed of different crops that brought much wealth.

The passing of cotton from its position as the money-crop is doing more to promote the prosperity of the Southern states than anything else, and all that remains for the South again to take its place as one of the most prosperous sections of the nation is a more proportionate distribution of the crops now being produced by the diversification program to which much interest is being given.

It has been with much impatience that business leaders of the nation have awaited the full carrying out of the diversification program, but when it is reflected that the purpose sought is the drastic curtailment of a crop that has been grown in this section since the earliest history of its white settlement—and at one time with very great profit,—it must be understood that this is something not to be expected overnight.

COVER ICE CREAM BARS WITH GOOD CHOCOLATE.

However, there are many indications that diversification in all of its rich promises is near.

We will take, for example, one state that is typically Southern—Georgia. Twelve commercial crops were produced in this state this year. In the neighborhood of a million dollars worth of tobacco has been marketed in the past few weeks, from scattering little strips in the lower part of the state alone—and this product that just a few years ago was entirely unknown to Georgia.

Gazing from trains traversing what formerly has been regarded as the cotton belt, persons used to seeing in this territory veritable seas of white cotton balls are astonished now to see cotton taking up only scattering acres, among acre after acre of corn and other products.

The dairy industry is coming into its own. A few years ago pure-bred cattle were a strange sight on Southern farms. Later, when dairying was introduced about six years ago, the average went up to about one-half cow to the farm, against two, three or four for the northern and western states. Exact figures have not been available since the rapid progress that has been made in the last several months, but there is little doubt that the near future will find a dairy cow to virtually every farm.

Perhaps the most striking indication of immediate improvement of business conditions in the South is the recent report showing that Southern cotton mills are running three-fourths more "spindle-hours" than are are the mills of New England. This shows that the South is beginning to make the most of its every resource. Whereas, it formerly produced for northern industries, it now is feeding its own factories.

Advance preparations for the 1922 convention of the Southern Association of Ice Cream Manufacturers give every indication that this event will be a most noteworthy gathering.

Even at this early date the eyes of the Dixie industry are turned upon New Orleans, where the ice cream clans will assemble in December. Secretary J. W. Clopton is authority for the announcement that the 1922 program will be one of the most constructive and informative that a Southern body has heard.

Reports from New Orleans are that the manufacturers of the Crescent City are making extensive preparations for the entertainment of their visitors. It is assured that delegates will not find time heavily hanging upon their hands.

President W. W. Campbell, from his home at Shreveport, La., announces that he wants "the boy's" trip across the river to be the most pleasant they have ever taken.

The interest taken in the coming convention by many supply firms leads to the belief that the exhibition features this year will be of much more importance than at previous conventions in the South.

It has been suggested to officials that a regular committee be appointed to take over preparations for staging a regular exhibition in connection with the 1922 convention. No official action has been taken in this direction, however.

* * *

The first plant in the South to be fully equipped with glass-lined equipment is that of the Savannah Cooperative Creamery, which will be completed by the first of the year. It will produce ice cream and butter and will market milk and buttermilk.

This plant, which was designed and equipped by Bessire & Company, will have glass partitions to enable visitors to see different parts of it in operation at all times.

It will be the first plant in the United States to employ the use of the Angel container, a product that has been given the unqualified indorsement of health authorities.

This container is made of paraffine admitting view of the cream line. The paraffine is made into containers by a machine entirely automatic, which receives the paper already cut in forms to be shaped into containers.

Another plant of the same nature is planned for Jacksonville.

* * *

The Dixie Ice Cream Company is a new concern to take the field at Macon, Ga., under the direction of J. E. Chamdler, prominent Macon cotton broker; W. C. Ivey, formerly ice cream maker for the Kinnett-Odum Company, and Ben Fetner, formerly mechanician for the Kinnett-Odum Company.

It began operations in September and has a capacity of 1,000 gallons a day.

* * *

"Daddy" Williamson, head of the Williamson Ice Cream Company, of South Pittsburgh, Tenn., is looking forward to the coming convention of the Southern Association.

"Daddy" tells The Ice Cream Review's Southern correspondent that he anticipates the pleasure of comparing notes between the governor of Georgia and the governor of Louisiana, and he absolutely refuses to appear on a convention program unless it is understood that Louisiana's chief executive shall introduce him.

* * *

Joe Flowers, head of the Flowers Ice Cream Company, of Thomasville, Ga., recently was in Atlanta long enough to report a favorable outlook for his business.

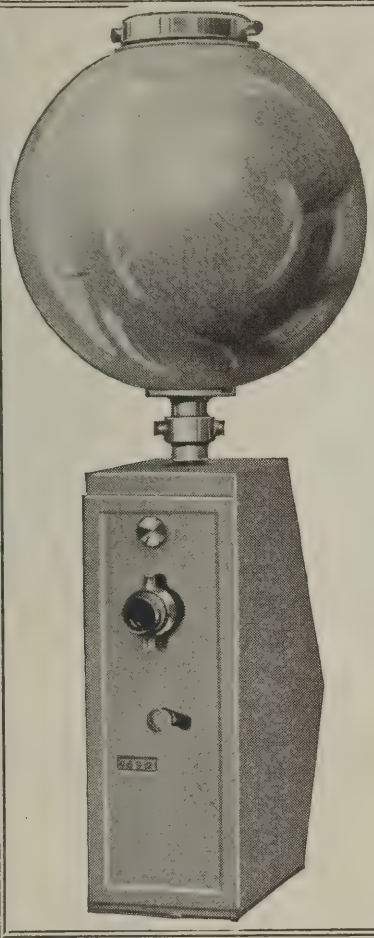
* * *

Mrs. Jack Kearney, wife of the popular representative of the National Paint & Varnish Company, is rapidly regaining her health after an operation in an Atlanta hospital weeks ago. The Kearneys are among the most popular members of the Atlanta colony of ice cream supply men.

* * *

Roy Jennings, of Mojonnier Bros., is highly pleased with his Southeastern territory.

* * *



John Sancken, secretary of the Tri-States Association of Ice Cream Manufacturers, was on the high seas a few days ago, on a visit to Europe with Mrs. Sancken. He will be back in time for the Southern convention in December.

The Weibatch

(TRADE MARK)

WHY U SHOULD USE THE WEIBATCH

IT WEIGHS

Every ice cream manufacturer knows that the specific gravity of mix is constantly changing and that any measuring device, no matter how accurate it may be in volume, is very misleading when checking back against the mixing, freezer, and hardening rooms.

Our Weibatch gives you accuracy in every batch, resulting in a uniform standard of ice cream.

The desire of the up-to-date ice cream manufacturer for an accurate weight of mix to the freezer has resulted in the development and perfection of the Weibatch.

Let the Weibatch weigh your mix, and you will have a check for the office of ingredients used, a record on the hardening room, and a uniform standard of ice cream with every batch.

Eliminate guesswork, weigh the batch!

THE "ELECTRIC WELD" PICNIC.

A most successful Sales Convention was held recently by the John Wood Manufacturing Company, Conshohocken, Pa., manufacturers of "Electric Weld" Range Boilers, Tank and Ice Cream Cans. Branch managers from the various offices throughout the United States attended this Convention which lasted one week.

On Wednesday night there was a dinner at the Manufacturers' Club, Philadelphia, followed by a theater party, and on Friday night a dinner at the Plymouth Country Club which was attended by the executives, heads of departments and foremen. More than fifty gathered at this Annual Dinner. The menu was made up of dishes named after products and operations in the factory. Those who attended included:

Frank Sutcliffe, President.
Victor Mauck, Chairman of the Board of Directors.
Herbert Mauck, Vice-President and Treasurer.
David M. Ramsey, Asst. Sec. and Treas.
Morris H. Feldman, General Manager of Sales.
John Wood, Founder of the Firm.
A. T. Sponar, Sales Manager of the Ice Cream Can Department.
George Hofstetter, Jr., Asst. Sales Mgr. of the Can Department.
Robert W. Simpson, Boston Manager.
Earl D. Freas, Philadelphia Manager.
Albert Jones, of the New York Office.
John J. Callahan, New York Branch Manager.
Joseph Montague, of the New York Office.
William Taylor, Chicago Branch Manager.
Elmer G. Boehm, of the Chicago Office.
E. L. Jenness, Cleveland Manager.
John H. Wood, of the Cleveland Office.

All Eyes on Cleveland

THE eyes of the ice cream world are now turned toward Cleveland.

The National Association of Ice Cream Manufacturers, The Association of Ice Cream Supply Men, and hundreds of individual ice cream manufacturers and manufacturers of supplies, equipment and machinery, have the combined National Convention-and-Exposition in Cleveland, October 16th to 21st inclusive, now foremost in their minds.

No such absorbing and widespread interest has been witnessed in the ice cream industry before.

According to The Association of Ice Cream Supply Men, which is promoting and will manage the National Exposition in the magnificent new $6,000,000 Public Hall in Cleveland, the outstanding feature of the week of October 16th will be the attendance at the 22nd annual convention of the National Association of Ice Cream Manufacturers, and at the Exposition, to be held two blocks away from the Hotel Hollenden, meeting place of the convention.

Cleveland hotels, according to the Association, have reported that more rooms have been reserved six weeks before the Exposition dates than has occurred in preparation for any other convention or exposition in Cleveland for years.

Recent exposition announcements by the Association have reproduced such reports from salesmen and executives who have been traveling extensively in the last month, as: "I know of only half a dozen ice cream plants that will not have some representatives at the convention-and-exposition in Cleveland."—"There will be at least 1,500 persons directly concerned in the ownership and operation of ice cream plants registered at the National Exposition."—"I know of four or five special cars that will be run into Cleveland from different directions for the special benefit of ice cream manufacturers. It may be that some of these groups will increase so that special trains will be made up."

At the same time that more than 100 manufacturers of supplies, equipment, machinery and special services for ice cream plants are making announcements to the industry in general that they will be represented in the National Exposition, ice cream manufacturers themselves continue to display the warmest appreciation and support of the National Exposition as well as of the National Convention of their own organization.

In releasing for publication recently a letter by the president of the New England Association of Ice Cream Manufacturers, carrying a strong endorsement of the National Exposition, the Association commented:

"Recent expressions of approval and urgent recommendations to their fellow ice cream manufacturers to attend the National Exposition and the annual convention of the National Association of Ice Cream Manufacturers have reached the industry recently from A. M. Le Messurier of the Syracuse Ice Cream Co., Syracuse, N. Y.; W. M. B. Sine of the Imperial Ice Cream Co., Clarksburg, W. Va.; Bert H. Walker of the Royal Ice Cream Co., Tacoma, Wash.; and L. M. Hendler of the Hendler Creamery Co., Baltimore, Md. The Association of Ice Cream Supply Men is proud to receive the communications it has from such representatively successful ice cream manufacturers as Messrs. Le Messurier, Sine, Walker and Hendler."

The letter of the president of the New England Association of Ice Cream Manufacturers, Mr. George W. Kenison, adds another to the communications to which the Association's statement referred. Mr. Kenison's letter says:

The Association of Ice Cream Supply Men,
1328 Broadway,
New York City.

Gentlemen:—The reasons why every ice cream manufacturer in the country, either large or small, ought to attend the convention of the National Association of Ice Cream Manufacturers at Cleveland this Fall are self evident. But the fact remains that there are still many manufacturers who do not appreciate the advantages which come from the national and sectional associations of ice cream men and who do not attend the conventions of the National Association or the Expositions of the Ice Cream Supply Men.

I do not know a large manufacturer of ice cream who does not keep in touch with the Expositions such as you contemplate in Cleveland this Fall and in my estimation that is one of the principal reasons why they are large manufacturers for if we had not kept in touch with what others are doing in the industry, had not learned of the new processes and equipment that are being made possible by invention, we certainly could never be anything more than small manufacturers.

The opportunity to "rub elbows" with ice cream manufacturers from other sections of the country who are not competitors and who, in most cases, are glad to give brother manufacturers the advantage of their own experience along many lines, is alone worth the cost of attending the convention; the opportunity to keep in touch with all of the new equipment and supplies that are continually coming on the market, and the opportunity to learn just what the other fellow is doing, much more than compensates for the time involved and the money expended.

Knowing the type of Exposition the Association of Ice Cream Supply Men has put on in Buffalo, Philadelphia, Atlantic City and other places, and knowing the efforts that they are making to have the coming Exposition excel all previous ones, I cannot wait to get out to Cleveland in October and am sure that every ice cream manufacturer will be more than well paid by attending your coming Exposition

Trusting you will succeed in your efforts to make the coming Exposition the best you have ever had, and with kindest personal regards, I am,

Yours truly,
(Signed) G. W. KENISON,
Pres. N. E. Association of Ice Cream Manufacturers

An entertainment program to out-feature any other ever held in connection with an Exposition for the ice cream industry is being completed by The Association of Ice Cream Supply Men. Particular recognition is being given in its preparing to shopping, theatrical and social diversion for ladies.

As to the make up and physical character of the Exposition itself, all display booths and fixtures, which are being made particularly for the National Exposition, are completed and ready to set up at the proper time for the installation of exhibits. The greatest demand for display space ever experienced by The Association of Ice Cream Supply Men now exists. More than 100 companies with displays occupying spaces ranging from 1,100 square feet to 100 square feet will participate in the Show.

The Association expects to issue a complete list of exhibitors and a definite entertainment program in the near future.

A CORRECTION.

The Elite Chocolate Coated Baseball Company of El Paso, Texas, was reported in The Ice Cream Review last month, through error, as being a member of The Association of Ice Cream Supply Men.

The Elite Chocolate Coated Baseball Company had not, at that time, applied for membership in The Association of Ice Cream Supply Men.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—St. Paul-Minneapolis, Oct. 7-14.

What Is A Fair Standard For Ice Cream?

By R. M. WASHBURN, formerly Professor Dairy Husbandry University of Minnesota, and Chairman of Ice Cream Standards Committee American Dairy Science Association

WHAT IS A FAIR STANDARD FOR ICE CREAM?
By R. M. Washburn, formerly Professor Dairy Husbandry University of Minnesota, and Chairman of Ice Cream Standards Committee American Dairy Science Association.

Ice cream is very distinctively an American product, even though it was known in some form for several hundred years in Europe before it was introduced to this country. In Europe and during times past it bore slight resemblance to the mellow creamy uniform article of the present. Then, too, our people were the first to develop the wholesale manufacture of ice cream, to introduce ice cream parlors and in general to develop the ice cream habit. Before the world's disturbance ice cream might have been had in sea port towns in nearly every part of the world and on most ocean liners, and yet it was the American made product, taken chiefly from New York City. In other parts of the world ice cream is a kitchen product made where served, and varies in quality accordingly.

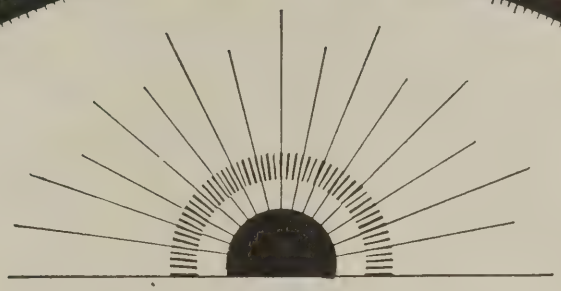
R. M. WASHBURN.

As a Confection.

Ice cream, until very recently, was classed as a confection along with candy and soft drinks and as such came close to being ruled out of business at the time of the greatest shortage of sugar, and it was fortunate indeed that food officials counseled with the ice cream manufacturers and others regarding the product, for then it was pointed out that, being made of cream, condensed milk and sugar chiefly, it possessed very definite food values.

As a Food.

Critical analysis of ice cream revealed the fact that it possessed much of the same food properties as butter or cheese, which are made from the same general source, though naturally differing in its nutritive relation. In the past, ice cream (so-called) has been made from probably thousands of combinations of milk, cream, eggs, sugar and condensed milk, so that when the article first entered commerce it varied greatly in its value, and after growing to considerable proportions seemed to demand a standard especially as to fat content. This was done to guarantee to the consumer that a proper amount of food nutriment might be obtained with a given purchase. The question was what the standard should be. One group of workers advised that the fat standard of ice cream should bear a definite relation to the fat standard in cream which was legal in the community in which the ice cream was made. This, however, seemed illogical to a few workers who believed that the fat content of ice cream should be governed by the product and its uses, rather than by the raw material from which it was made.



Based on Cream.

The first fat standard for ice cream to gain general recognition was that advocated by the national pure food law which fixed 18 per cent fat as the minimum. Using this as a basis and reasoning that since the introduction of sugar into the cream in sufficient amount to make it palatably sweet, would dilute or reduce the fat content to nearly 14 per cent; that 14 per cent should therefore be considered as the legal minimum of fat for ice cream.

It is now generally recognized and recently sustained that the various states have the right to establish and enforce standards in food commodities. It is likewise established that cities of the first class have this right where such does not conflict with the state. Therefore, the fat standards of ice cream would become as variable as the cream standards in the several states and cities if ice cream were to be based upon cream. For instance, the legal standard of cream in Minnesota is 20 per cent, Wisconsin 18, and Iowa 16. Consequently the ice cream fat content should be about 17, 15 and 13, respectively. Consequently, if a manufacturer located at, say Winona, La Crosse, or Decorah, shipped into the three states named, he would either have to make three grades, keep them separate in his storehouse and in the shipping which would be next to impossible, or he would have to put into all his cream enough fat to meet the highest requirement and be very much handicapped in meeting the competition in the states requiring less fat. As between cities, we notice that 20 per cent fat in cream is demanded in Los Angeles, Portland, Spokane, Memphis, Minneapolis, and Washington, D. C., while 18 per cent suffices to satisfy Toledo, Syracuse, Seattle, Philadelphia and New York, and 16 per cent is enough for Newark, N. J., Columbia, S. C., and Denver, colo., but again we note that the ordinances of Chicago, St. Louis and Boston require but 15 per cent fat, with Beaumont, Texas, requiring only 13 per cent. In this medley of requirements we find a variation of nearly 50 per cent and upon what fact of life or need are they based. Indeed, we must believe that these standards were established as compromises of judgment or as the opinion of the dominating member of the council. Not only in scattered cities do we find discrepancies in fat standards of cream, but in cities within the same state. Thus, Spokane demands 20, Seattle, 18; Boston, 15, Fall River, 16; Houston, 18; Beaumont, 13; Detroit, 18; Flint, 20; St. Louis, 15; Kansas City, 18. Again we can imagine the struggle any dealer would have trying to meet competition and at the same time live up to such a medley of requirements. Cities located in different states but close together offer an even more distressing possibility. Thus, Kansas City, Missouri, requires 18 per cent fat in cream, While Kansas City, Kansas, is satisfied with 16 per cent; St. Louis, Missouri, 15 per cent and East St. Louis, Illinois, 16 per cent.

Consistently carried out, therefore, the basing of the ice cream standard upon the cream standard for the state and city in question would introduce at best a useless confusion, unwarranted by any real need or good to be done.

TRADE MARK REGISTERED

Won! The first flagrant infringer of the Eskimo Pie patents has been enjoined by a Federal Court—the honest right of the inventor has been upheld. And the way is clear for still greater successes with this phenomenal ice cream product. Eskimo Pie Corporation, 5 North Wabash Ave., Chicago.

10c

A PRETTY PACKAGE PROVIDES PLENTY OF PURCHASERS FOR YOUR PRODUCT.

Other Dairy Foods.

Other manufactured dairy foods are not dependent upon the composition of raw material for their standard, thus butter, whether churned from thin cream or thick cream, must not contain to exceed 16 per cent water, nor according to the United States Pure Food Law less than 82½ per cent fat. Likewise, cream whether extracted from Holstein milk testing 3.4 per cent, Shorthorn testing 4 per cent, or Jersey testing 6 per cent, must contain the quantity of fat specified in the ordinances of the city in which it is sold, and this we have noted, varies in general from 15 per cent to 20 per cent. In general, about 20 per cent of the volume of milk is extracted as cream, but if this simple proportion were maintained, we would have Holstein cream testing from 16 to 17 per cent fat, and Jersey cream testing from 26 to 30 per cent fat. In my judgment the fat content of cream should be based upon the needs of cream, not upon the fat content of the milk from which it was derived, just as the acid content of vinegar should be 4 per cent in order that it may preserve pickles rather than based upon the sugar content of the apples from which it was made, or in the case of white wine vinegar, the per cent strength of alcohol from which it was made.

Non- uniformity of requirements is one of the exasperating features of interstate commerce and few, if any, articles are already more tangled as to state requirements than ice cream. This is shown by the following list of states, with the fat standard of ice cream stated:

United States....No standard. All attempts to enforce circular 19, requiring, 14 per cent fat, have failed.
Alabama .....14 per cent by reference to United States.
Arizona .....10 per cent for vanilla—8 per cent fruit, nut and chocolate.
Arkansas .....No standard.
California .....10 per cent and 8 per cent.
Colorado .....14 per cent and 12 per cent.
Connecticut ..... 8 per cent and 6 per cent.
Florida .....12 per cent.
Georgia ..... 8 per cent.
Idaho .....14 per cent by reference to United States.
Illinois ..... 8 per cent.
Indiana ..... 8 per cent.
Iowa .....12 per cent.
Kansas .....14 per cent by reference to United States.
Kentucky .....10 per cent and 8 per cent.
Louisiana .....10 per cent and 8 per cent.
Maine .....14 per cent by reference to United States.
Maryland ..... 8 per cent and 6 per cent.
Massachusetts ... 7 per cent.
Michigan .....10 per cent.
Minnesota .....12 per cent.
Mississippi ..... 8 per cent.
Missouri ..... 8 per cent reduced in 1919 from 14.
Montana .....10 per cent reduced in 1919 from 14.
Nebraska .....14 per cent and 12 per cent bill now in legislature to reduce.
Nevada .....14 per cent and 12 per cent.
New Hampshire..14 per cent.
New Jersey.....No standard.
New Mexico.....No standard.
New York.....No standard.
North Carolina... 8 per cent.
North Dakota....10 per cent and 8 per cent.
Ohio .....No standard.
Oklahoma .....10 per cent and 8 per cent.
Oregon ..... 8 per cent and 6 per cent.
Pennsylvania .... 8 per cent and 6 per cent.

Ice Cream Based on Own Needs.

It is a fundamental law in the nutrition of animals of all species that three general classes of foods are needed, namely: ash for bone building, protein for muscle construction, and sugar cellulose or fat for heat formation. Natural milk, which is universally conceded to be the most nearly perfect food, contains these various substances approximately in the proportions shown in table 1. Ash is present in minor but useful quantities. Sugar is present to the amount of about 4.88 pounds to 100 pounds of milk. Sugar does the same work as fat in the body, namely: it furnishes energy for work and heat for warmth. Protein is the general name for casein, albumin, and the other minor similar substances. Its chief function is muscle building. Fat, about 3.69 pounds to the hundred, serves to produce heat, energy and fatness. The great difference between fat and sugar is that fat is 2¼ times more heating than sugar and is in general more difficult of digestion. Protein and sugar have heating powers practically identical. Therefore, by multiplying the fat content by 2¼ we have reduced it to the same terms as the other food nutrients, or, in other words, we have reduced the several substances to a common denominator and therefore can add them direct. Doing this, we find that the total starch value of 100 pounds of ordinary milk is about 16.43, or, in other

TABLE 1.

Composition of milk.	per cent		per cent
Water	87.17		
Solid	12.83		
		Ash	0.71
		Sugar	4.88
		Protein	3.55
		Fat	3.69
Total starch value			16.43 pounds
Total energy value			29,804 calories
Nutritive ratio			1:3.7

words, 16.43 pounds of dry starch or wheat flour would be required to equal 100 pounds of milk of this grade. The heat or energy value of foods is measured in calories of which the food contains about 29,804. The proportion, or ratio, between muscle producing and the heat producing foods is called the nutritive ratio and in average milk is about 1:3.7. For comparison we may study the composition and value of 20 per cent cream as shown in table 2, which we find has a starch value equal to 52 pounds, a total energy value of 94,328 calories, thus indicating a richer food; but, likewise, we must note that

there are 16.3 times as much heating food as muscle making food in cream of this grade, or, in other words, the nutritive ratio is 1:16.3.

Evaporated milk furnishes an excellent comparison with cream since it contains so nearly the same amount of total solids, namely about 27 per cent, but differs from the cream chiefly in having a much higher protein content and lower fat content. This is shown in the starch value of 35.87 as against 52 and in the total energy of 65,068, as against 94,328. The proportion of muscle to heating properties in evaporated milk is shown to be about 1:3.8, practically identical with that of normal average milk. In this substance we have then high solids without high heating.

TABLE 2.

Composition of 20 per cer cent cream.

	per cent		per cent
Water	72.41		
Solids	27.59		
		Ash	0.59
		Sugar	4.00
		Protein	3.00
		Fat	20.00

Total starch value....52.00 pounds
Total energy value....94,328 calories
Nutritive ratio....1:16.3

TABLE 3.

	per cent		per cent
Water	73		
Solids	27		
		Ash	1.5
		Sugar	9.7
		Protein	7.5
		Fat	8.3

Total starch value....35.87 pounds
Total energy value....65,068 calories
Nutritive ratio....1:3.8

The composition of what we may term "old fashioned" ice cream, as shown in table 4 reveals a comparatively low ash, low protein, and high fat with an energy value of 98,718 calories, indicating a rich food, but with a ratio of nutrients indicating more than 17 times as much heating as muscle producing food. By comparing this with table 5, showing the composition of modern ice cream, we note that the ice cream which has been made up in part by the use of condensed or evaporated milk, and contains, therefore, higher proteins and a lower fat content has only about 85 per cent as much heat in it per pound as the old style compound, or in other words, the 14 per cent fat ice cream contains about 20 per cent more heat than does modern ice cream. While an examination of the ratio or proportion of nutrients in the modern indicates that there are only about six times as much heating as muscle producing food, or, in other words, the nutritive ratio of the modern ice cream is about 1:6.0 as compared to 1:17.1 in the old style.

TABLE 4.

Composition of "old fashioned" ice cream.

	per cent			per cent
Water	63.75			
Solids	36.25

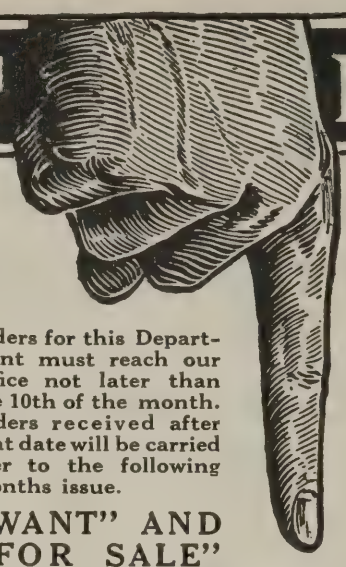
		Fat		9.40

Total starch value....46.4 pounds
Total energy value....84,142 calories
Nutritive ratio....1:6.0



High fat ice cream is hot; that is, contains a large quantity of heat units compared with that containing less fat, and since it is a generally recognized principle that people in summer should consume less fats and more fruits and cooling foods, it is directly in line with the advice of the health bureaus, dietetic experiments and physicians to maintain that ice cream, which is consumed most largely in summer for its cooling effect, should be chemically cool while being physically cold. Therefore, the fat standard for ice cream, based upon the needs of the people eating the ice cream, would be comparatively low, say 8 to 10 per cent.

In conclusion, it seems clear that (1) a standard for composition is needed, (2) the composition should be based upon the needs of ice cream as a food and not upon some standard for cream and (3) a fat percentage of 10 per cent for plain vanilla ice cream and 8 per cent for fruit, nut and chocolate ice cream is sufficient for all useful purposes.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in The Ice Cream Review.

WANT DEPARTMENT

HELP WANTED

If you want help for your factory, the quickest and cheapest way to locate same is through The Ice Cream Review Want Department.

EMPLOYERS!—Men, men, men—the crying need of the day! If you need any men in your business today, read the following ads and see if you can use any of these. The fact that these men are advertising here stamps them as unusually progressive. Write them and give them a chance to sell their services to you. "Ice Cream Review," Milwaukee, Wis. tf

WANTED—Thoroughly experienced ice cream maker. Must know how to make French and fancy ice creams of every description. Permanent position good salary, Midde west. Apply giving name, age, places employed, salary desired. Position open at once. Address: R-313, Ice Cream Review. 9-22

WANTED—Competent ice cream and butter maker for small new plant. Must thoroughly understand the making of fancy ice cream, sherbets, individual moulds and bricks, as well as commercial ice cream. Party must be able to take full charge of manufacturing end of ice cream and butter department. Splendid opportunity for right party. Give full details of experience and state age, whether married or single and salary expected. Raton Creamery Company, Raton, New Mexico. 11-22

WANTED SALESMAN — Colors and Flavors. Good, permanent position for the right man. Territory south and west. Headquarters to be in St. Louis or Kansas City. Give full particulars as to past experience. Address: R-320, Ice Cream Review. 9-22

WANTED—Energetic representatives to sell Extracts; those acquainted with the trade, ice cream trade preferred. A rare opportunity offered. The Mayborn Food Products Co., Cleveland, Ohio.. 9-22

WE WANT—25 Go-Getter salesmen calling on creameries. $20.00 per day will only be a moderate commission for a live salesman. Send $1.00 for sample and case. H. Kirk White, Oconomowoc, Wis. 9-1

WANTED — A first class ice cream maker for first class plant. Steady employment. Box 54, Bristow, Okla. 10-22

POSITION WANTED

POSITION WANTED—University graduate in dairy manufactures with several years experience in plant and department management desires position as manager or assistant manager of production with large ice cream firm. Familiar with modern methods and equipment. Available after September. Address: R-303, Ice Cream Review. 9-22

POSITION WANTED—By an ice cream maker who thoroughly knows the business in all its branches. Please state full particulars in first letter. Address: R-314, Ice Cream Review. 9-22

POSITION WANTED—By bacteriologist and chemist, with reliable firm. Married. Have had eight years experience in the Dairy Industry and can give best of references and qualifications.. Address: R-315. Ice Cream Review. 9-22

POSITION WANTED—As superintendent of ice cream plant or combination. Experienced in all phases of ice cream and market milk industry. University graduate.. Can handle men to advantage. No proposition too big. Eight years experience. Married. Good references. State salary and full particulars in first letter. Address: R-317, Ice Cream Review. 9-22

POSITION WANTED—By an ice cream maker who knows his business and not afraid to work. No proposition too big. Can give best of references of present and past employment. Address: R-319, Ice Cream Review. 9-22

WANTED

WANTED TO BUY—Modern ice cream plant, in city of 5,000 to 20,000 population. Good railroad center. Good up-town location. Write: R-318, Ice Cream Review. 11-22

Visit the Great CP Exhibit at the National Dairy Exposition

MINNEAPOLIS – ST PAUL

OCT - 7TH TO 14TH

1922

INSTRUCTIVE PLAN NOW

INTERESTING TO COME

VISITORS to the 1922 National Dairy Exposition are invited to make their headquarters at the spacious ***CP*** Exhibit. This is just inside the main entrance and is the largest display at the exposition. Guests will find a comfortable rest room, check rooms, telephones and every convenience for their comfort.

The Creamery Package Exhibit is the greatest at the Exposition both in size and in variety of equipment. Here you will see a tremendous array of machinery for the butter maker, the ice cream maker, the milk dealer, the cheese maker and the dairyman.

Don't fail to see the Master Dual Churn and Worker—the largest churn ever built—the new four roll Victor Churn and Worker, the ***CP*** Rotary and ***CP*** Hydraulic Can Washers, the Ft. Atkinson 100 and 40 quart Freezers, the many applications of Wizard Vats, the new ***CP*** Brick and Eskimo Pie Cutter and many other marvelous machines.

Remember this exhibition is displayed for your inspection.
